TRANSMISSION SECTION

BUYERS who are interested in Transmission Equipment and Supplies will do well to study the advertisements in this section.

Gathered here will be found the sales messages of leading manufacturers and dealers.

They are good people who pride themselves on their service as well as the goods they sell. They are reliable and ready.

Their products have stood the searching test of being subjected to the steady glare of continuous publicity.

You can't go wrong if you patronize them. You can go right if you do.

Think of a good product in any line and you will think of one that's advertised every time. You know why.

LINK-BELT
SILENT CHAIN DRIVES

TODAY, conservation is the watchword throughout the nation, not only in food and fuel consumption, but human energy and power as well. "Who Saves Serves."

Link-Belt Silent Chain Drives not only save power, but they speed up production and enable each man to accomplish more work each day as well. They are helping to hasten the production of war munitions everywhere.

Long after belts have slipped a million times—long after gears fail to mesh properly and are making a noise like a "rattle trap"—years longer, Link-Belt Silent Chain Drives will be operating as smoothly and efficiently as ever.

For Link-Belt Silent Chain Drives are "flexible as a belt, positive as a gear, and more efficient than either." Proof is given in our Machine Tool Drive Book No. 312. Send for a copy.

A 110-foot x 46-inch x 10-ply ANACONDA Bucket Elevator Belt. Handles 1750 tons crushed rock per day.

Now is the Time for Manufacturers to Lay By their Power Reserves

OUR country's resources must finally decide the issue for Democracy.

Business and industry in this country *must* "carry on." *Manufacturers should begin to build up reserves of coal, spare machines, belting and raw materials now!*

The Government is asking coal users to be forehanded in placing orders. *It is asking you to conserve coal.*

There are more ways to save coal than merely under the boilers.

Power losses—*production losses*—are caused by inefficient forms of power transmission; by unscientific belting; and by the use of inferior grades of belting material.

For this reason many factories to-day are buying all belting on a service basis and are stocking reserves.

Not every type of belting can be sold on a service basis. It has taken from twenty to thirty-five years to prove to some manufacturers that there is even *one* belting which can be bought that way.

But these men are now buying Leviathan-Anaconda belting on just that basis.

Leviathan-Anaconda is sold direct to the user especially for the position on which it is to be used.

It is sold after a survey of that position by one of our men. It is subject to periodical inspection. It is treated with the consideration to which its importance entitles it.

The most forward looking manufacturers now know that it is a mistake to buy belting as material—so many feet at so much per foot.

The way they buy Leviathan-Anaconda now is on the basis of length of life, number of pieces of finished product turned out; or in the case of conveyor belting, tons of material carried.

You know the type of manufacturer who says that this is not the time to change over. *This is decidedly the time for change to efficiency.*

Our service begins upon your receipt of a sale of Leviathan-Anaconda — no matter when it is to be used —and is continuous thereafter.

The quickest way to get Leviathan - Anaconda Service working for you is to write or wire our nearest district office.

THE JOHNSON FRICTION CLUTCH

In the "Snyder" and a Host of Other Drill Presses

We feel justified in saying that Johnson Friction Clutches are in use wherever efficient drilling machines are manufactured.

Every day sees new names added to our long list of machines which have Johnson Friction Clutches in their design. This wouldn't be so if there wasn't something a little better than ordinary about Johnson Friction Clutches. A simple request for information about your own proposition will bring surprising details and prices.

WHEN You Plan Your Drives, PLAN for
SERVICE, DURABILITY and EFFICIENCY

COST-FINDING and COST-KEEPING are the Essentials of Prudent Management and Success

Read! Think! Consult every authority on belting, power transmission, belt speeds, slip, pulley surfaces, cling surfaces, belt dressings.

Figure the sum total of your series of losses and expense in your series of power-driving units.

Trace your daily power loss to the source.

It's appalling when you put a fine point on your pencil and bring your transmission losses into the Spot Light, and place same alongside your Cost Account.

Morse Rocker Joint Silent Chain is the only 99% efficient power transmission not dependent on an Oil Bath for Service and Durability. Positive as Gears. Flexible as a Belt.

MORSE ENGINEERING SERVICE

AIMS by thorough analysis of your power service to determine what can be done to increase production at the same time lowering costs and maintenance, submitting reports of the individual specializing expert, going deep into your problem showing the saving in space and construction costs.

Ask for information and special report. Assistance free without any obligation.

MORSE Drives insure profits against competition.

REMEMBER THE BOND

Universal Adjustment

Babbited and Reamed Bearings

Case Hardened Steel Set Screws

It cuts the danger of hot bearings to a minimum because it is equipped with an up-to-date and efficient ring oiling device that keeps the bearings constantly oiled, without wasting oil. The reservoir once filled requires no attention for at least six months. Any misalignment in the shaft line is easily corrected by the universal adjustment.

Our catalog on Power Appliances is full of pointers. Send for it to-day.

Canadian Bond Hanger & Coupling Co., Ltd.
ALEXANDRIA, ONTARIO

IF you like Canadian Machinery, talk about it, tell your friends, drop a word or two here and there as you go along the line of your daily activities.

If you don't like it, or if you think it could be made of greater service to you, tell us.

The old saw about silence being golden has its limitations.

PLEASED—

Ordering large shipment of

S K F Hangers

The illustration shows a department in the plant of the Flint Varnish Works, Flint, Mich., equipped with SKF Ball Bearing Hangers.

The service records of SKF Transmission Equipment in this and other departments have saved appreciable amounts of power and oil, besides doing away with shutdowns from hot boxes.

Their experience has been so satisfactory that they write: "We are very well pleased with the way SKF Ball Bearing Hangers have acted and are now ordering a large shipment to come in, to be used in connection with the new equipment being installed."

Why not get better acquainted with the money-saving possibilities of SKF equipment in your plant?

The SKF Transmission Bulletin contains complete information. Send for it.

A Big Labor Saver

One Man with this

Universal Ball Bearing Elevating Truck

can do the work of a number of men with a number of ordinary trucks

All material is stacked on the platforms. To move material the truck is backed under the platform, the handle of the truck is then pushed down, keeping the button depressed, which raises the truck bed, and with it the loaded platform, at the same time automatically locking it in its raised position.

When hauled to the desired position the button is pressed and the handle raised, lowering the platform to the floor. The truck is then drawn from underneath and is ready to move another platform.

Raising and lowering of the truck can be operated with one hand—can be raised or lowered at any angle.

Specially designed Chapman Ball Bearings are used on the Universal Truck. This assures the highest efficiency in a vital part and lends ease and convenience in its operation.

Send for literature telling all about the truck and its cost-cutting uses.

The Chapman Double Ball Bearing Company

OF CANADA, LIMITED 339-351 Sorauren Ave. TORONTO, CANADA

UNIFORM AND DURABLE

ROOT, NIELSON & CO.,
UNION IRON WORKS,

Magnolia Metal Co. Sacramento, Cal., Aug. 15, 1917.

Gentlemen:

We have been using Magnolia Metal continuously during the past ten years, on all of our work, including Automobile repair work, Ammonia Machines, Electric Motor and Motor Boat work.

The fact that Magnolia Metal is always uniform in quality, runs freely, and shows great durability, are reasons enough to warrant its use in all of our work. It has always given utmost satisfaction.

Yours very truly,

ROBERT McNAIRE, Supt.

Maximum Power with Minimum Belt Slip

The pulley question is a vital one. Slipping belts and wind-fanning pulleys are responsible for big power losses in many factories and mills.

A steel pulley—an iron pulley—a wooden pulley; that's the way many pulleys are bought. The result is waste of power.

Stop this waste. Specify

AMERICAN STEEL SPLIT PULLEYS

These pulleys save power because their flat A-braced arms minimize wind resistance.

Because the grooved air escape in their face diminishes the air cushion under the belt.

Because they combine lightness with great strength.

Because they require the least amount of time for installation.

The belt grips the whole face of the pulley except the grooved air escape, and exerts the maximum pull. American Pulleys will not work loose on the shaft under severe intermittent loads —a frequent cause of the belt slip when wood or heavy iron pulleys are used.

Write for the Free Book "Pulley Efficiency"—a valuable treatise on pulleys.

AMERICAN PULLEY COMPANY

Success and Your Associates

ALWAYS associate with men who are earning more money than you are. Such is the advice given by a man whose name is known the world over for his own success and the business which he created. It is good advice of a certainty, but we are not urging that it is the best advice. At the same time it is wise to associate with better or bigger men than you are yourself, because you are likely to be lifted up to their levels.

Most of us would probably like to be the intimates of J. P. Morgan, or of John D., or of Charlie Schwab, or Canny Andrew. If we had a speaking acquaintance with John Wanamaker, or Lord Beaverbrook, or Lord Shaughnessy, and with other distinguished and successful men, we would take comfort from the fact.

And most of us would feel rather small and uncomfortable if we were placed beside President Woodrow Wilson at a dinner table, or beside Sir Robert Borden, Sir Herbert Holt or Sir Wm. Mackenzie. And the reason would probably be that we know so little of the knowledge that really counts. If these successful business men engaged us in conversation we would probably find ourselves knowing very little about the things that matter.

This will illustrate the point:

Here's a true story. A Toronto manufacturer found himself on a train going to Albany in company with a number of distinguished Americans about to attend the inaugural ceremonies of a State Governor. A washout led to a delay, and the Canadian was thrown into close association with senators and congressmen and prominent lawyers. They bantered the little Canadian about Canada. He had the pluck of a bigger man. He had been a constant reader of THE FINANCIAL POST, and had absorbed many facts about Canada. He surprised his American travelling companions with his positive, well-informed and wide knowledge of Canada. When the company reached Albany, the Canadian was persuaded to attend the ceremonies and was introduced as the man who knew all about Canada. The Governor was interested in Canada, and said so, and the little Canadian found himself telling the story of Canada very ardently to a very attentive listener, much to the amusement of his friends who introduced him.

This man made a hit on that journey, and many friends. One of the company gave him a stock market tip worth a fortune.

The point of this story is: You, as a Canadian, can make yourself informed very fully and intelligently if you become a regular reader of THE FINANCIAL POST. You can make yourself a worthy companion and intimate of presidents and magnates. The world likes to listen to men who know something well, and who can talk interestingly and informingly on the subject of their study.

You can become worth listening to if you know your Canada well. And you can get the kind and amount of knowledge concerning Canada which will make you interesting to others if you will read THE FINANCIAL POST regularly each week.

IF you read THE FINANCIAL POST REGULARLY you will find yourself keeping company with the highest paid staff of editors engaged on any publication in Canada—trained men who know how to make others know what they know and learn.

You will find yourself living in a most interesting world—the great, throbbing world of business. You will have your thoughts tremendously stimulated and helpfully directed. You will find yourself becoming a fit table companion for big men — this because you will have knowledge of a quality that will keep you from shame.

What is it that keeps you and THE POST separated? It cannot be its subscription price of $3. Probably it is because you are not very well acquainted with this paper.

We are going to put it to you this way: If you have the desire to be worthy of association with big men, then prepare yourself for such association by reading THE POST, and to make acquaintance easy, we provide the coupon below. It offers you THE POST for four months for a dollar bill.

The MacLean Publishing Company, Limited,

Dept. C.M., 143-154 University Avenue, Toronto.

Send me / us THE FINANCIAL POST for four months for One Dollar. Money enclosed / to be remitted

(Signed)

.....

C.M. .....

"We have been using this belting on practically every kind of drive throughout our shop and have no hesitation in saying that same has given us entire satisfaction."—A Pembroke Superintendent.

Plays a Big Part in Shell Production

Three years ago it was unusual to find any belting except leather in machine shops.

To-day hundreds of Canadian shops are using Extra Power Belting. Some are belted entirely with Extra Power. One of the largest shell shops in the Dominion has used over 20,000 feet—practically every drive belt is Extra Power.

In fact, Extra Power Belting is playing an increasingly big part in Canada's shell production.

It is true that engineers and factory superintendents first discovered the merits of Extra Power Belting on hard, unusual drives.

But experience in shell shops has shown that Extra Power Belting is not a bit too good for ordinary drives.

The proven qualities of Extra Power Belting—long life, pulley-gripping flexibility, freedom from stretch—make it the best and most economical belt for high-speed lathes and every other type of machine.

Don't think you have paid for a belt when you have bought it. That's only the beginning of the belt cost.

To that first cost must be added the cost of every repair or adjustment on the belt—every hour machinery and men are idle—every dollar of the product's value lost by that idleness—every pound of coal wasted in inefficient transmission.

The Goodyear Belting man has a real story to tell you. He is a trained expert on belting problems. To use his service involves no obligation, adds nothing to the cost of your belting. But we *may* be able to show you a new road to increased production and lower belting costs.

Write or phone the nearest Goodyear branch—to-day.

EXTRA POWER BELTING

Just where do we stand?

CANADIANS are beginning to wonder where we stand with reference to our place in the Empire after the war. Are we to rank as full partners in this grand, big, going concern? Are we to pay our share of the upkeep of the navy? If not, what is to be our status?

Recognizing the growing interest in this problem, the editors of MACLEAN'S decided to devote the July issue to Imperial topics. It offers articles on various phases of our Imperial problem—articles which will have a particular interest at this time when Sir Robert Borden is in London in consultation with the leaders of the Imperial Government.

The July issue contains, besides, a cluster of other big features—readable, fearless and strong. Here are a few of the best:

Field-Marshal Sir Douglas Haig.

Imperial Topics
- "Pocketing Our Imperial Pride" By H. G. Wells
- "Canada's New Place in the Empire" By Prof. P. M. Kennedy
- "Living Up to Our Reputation" By Agnes C. Laut

The War - -
- "Your Old Uncle Sam is Coming Right Back of You" By Lieut.-Col. J. B. Maclean
- "Stemming the Teuton Tide" By Geo. Pearson

Fiction - - -
- "The Strange Adventure of the Open Door" - By Arthur Stringer
- "The Three Sapphires" - - By W. A. Fraser
- "The Torby Tragedy" - - By A. C. Allenson
- "The Magic Makers" - - By Alan Sullivan
- "Lennix Ballister—Diplomat" By Archie P. McKishnie

All the regular features as well: Review of Reviews, The Best Books, The Business Outlook, The Investment Situation, Women and Their Work.

July MacLean's

"Illinois" Thread Gauges are proving their accuracy and dependability in daily service.

One of 1,000 Lathes Whose Output

Murchey Collapsible Taps

Have Doubled

The photograph reproduced at the bottom of this page was taken a few days ago in a large Canadian shell plant. There is nothing unusual about this turret lathe except that it is tooled with two Murchey Collapsible Taps and for that reason alone.

THREADS TWICE AS MANY

75-m.m. Shells

One of the Murchey Taps does roughing, the other finishing; the shell in lathe is not removed until the nose is entirely and perfectly threaded.

The least expensive, quickest and surest way to increase shell production is to equip your lathes with Murchey Taps. Two to each lathe will not fail to increase production at least 50 per cent. Murchey Collapsible Taps are cleared free from the thread instantly. No time lost backing off; no danger of stripping threads.

Murchey Collapsible Taps and Automatic Self-Opening Dies play a big part in the rapid production of 75 and 155-mm. United States shells, British Shrapnel, high explosive shells and fuse sockets.

Ask us to-day for full particulars.

If You Need a

POWER HAMMER

of uncommon strength throughout — a hammer constructed to deliver work of surpassing quality in great quantity, and to keep everlastingly at it—

You Need Jardine's

Note a few particulars:

Hammer slide is a steel casting; so is the ram, and connecting bolts for the ram are machined from solid steel bar.

Hammer and anvil dies of properly tempered, highest grade tool steel, are held in machine seats by tapered keys in the ram and anvil block, so there's no need to put taper on the dies.

Jardine's Canadian Giant Power Hammer has never failed.

The City of Welland

Shows a remarkable industrial growth

MANUFACTURED PRODUCT VALUED AT $28,642,390

Every year in Welland is a record year—until the next one arrives. This is certainly true of the value of our manufactured products, which last year reached the astounding total of $28,642,390, an increase of very nearly fifty per cent. over the previous year, which, in turn, had shown almost as large a proportion of increase over the year 1915.

Workshop of the Dominion

These figures lend a new weight of proof to the common prophecy that the City of Welland is destined to be one of the first manufacturing centres of Ontario, and the zone of the Welland Ship Canal, the workshop of the Dominion.

"Only three cities in Ontario (Toronto and Hamilton excepted) showed so great a numerical gain. Not one city in Ontario showed so great a percentage gain. Welland's population increase was over 10 per cent., its closest competitor showed only eight, and the next one only six. Only these three cities in the province gained over 5 per cent. in population.

Pay Rolls Over Five and a Half Million Dollars

"Welland's industrial workers were paid last year $5,569,190, or 54 per cent. more than went into the pay envelopes in 1916.

Workers in Our Industries Number 5,305

"The number of employees in the industries increased by 415, and has now reached a total of 5,305.

Over a Million Dollars Spent on New Factory Buildings and Equipment

"Though Welland added but one industry in the year, the enlargement of industries already in operation and the adding of new equipment left a result quite equal to the addition of many new industries. In the enlargement of factories $346,469 was spent for new buildings and $682,113 for new equipment.

Welland Leads Sister Cities in Population Growth

"The population of the city, according to the 1917 roll, was 8,825, to which must be added another young city that lies about the large industries to the south and east. The gain within the limits in the year was 920, an addition that was equalled only in 1907 and 1914.

Customs Collections Grow, Too

"Customs collections at Welland in a year reached almost a million and a half dollars, a sum sufficient to place Welland among the first five cities in the province.

99 New Houses Put Up

"Building in Welland in 1917 reached a total of nearly a quarter of a million dollars, an increase over the previous year of nearly 25 per cent. New houses erected numbered 99. In 1916 there were 78 houses put up, and in 1915 only 40. Welland's house-building is still, however, far inadequate to meet the demands.

Assessment Grows Half a Million a Year

"The total assessment, as revealed in the 1917 roll is $6,758,990, an increase of over half a million dollars over the previous year. For the past eleven years we have increased our assessment on an average of over half a million dollars each year.

"Because of its strategic location in relation to rail and water shipping and its unrivalled facilities for the iron and steel trade, Welland could not be overlooked when the effort was begun to replace the Allied shipping that had been sunk by the submarine. The location of the first shipbuilding company at Welland was announced last spring. To-day two steel freighters are on the ways."

LOUIS BLAKE DUFF

Industrial Commissioner

WELLAND CANADA

Hepburn Rough Turning Lathe for 155-mm. Shells

60 6-in. H.E. Shells per Hour
with this
HEPBURN Shell Lathe

One shell every minute—that's the rate of production maintained hour after hour and day after day by the Hepburn Shell Lathe photographed at the bottom of of this page.

Photograph shows it chamfering the nose of a 6-inch shell in one of the largest munition plants in Canada. In this plant this same lathe is used for facing up the open end of the shells, and other Hepburn Shell Lathes on boring and rough turning operations are giving like satisfaction.

You will obtain both utmost economy and production at one and the same time by putting Hepburn Shell Lathes on your shell work. Ask for full particulars.

We rebuild and repair Lathes at a cost very reasonable owing to our exceptional facilities. Write us!

"Improved" No. 2 Cutting-Off Machine

Note the low swing.

Equipped with two-speed positive Steel Clutch and Steel Gears, 3" face. Effective pot chuck and centering device.

18 per hour guaranteed on open end cutting-off operation.

Sturdy. Economical.
Easy to operate.
Early delivery.

Globe Engineering Co., Ltd., Hamilton, Can.

BELLEVUE NOSING FURNACES

FOR nosing shells from 3 to 12 inches. Now being used by many munition manufacturers. An efficient adjunct of shell factory equipment.

Uses either oil or gas.

Bellevue Billet Heating Furnaces

A substantial furnace. Built in dimensions suitable for shells from 3 to 12-inch. Inclined so that shells loaded at one end may be worked through the heat with but very little labor. Various lengths.

Consult us about your furnace problems.

Sold in Canada by
H. W. PETRIE, LIMITED, TORONTO

MILLING MACHINES

FOR

Rapid Production of Motor Parts

The **demand** for increased production **requires tools** of **great strength** and **durability**; the Fox 2-A Universal Milling Machine illustrated has met this demand, and is being used wherever extreme accuracy and quantity production are required.

The machine has a universal table, spiral cutting attachment, 10″ Dividing Head with 6″ Universal Chuck, making it a machine **especially adapted for Tool Room Work.**

The **United States Government** is using this machine in its various **repair shops** for **Aeroplane Motors.**

You should be using this tool to help the production of parts necessary for the prosecution of the war.

Specifications — No. 2-A Miller.

Spindle speeds 12
From 21 to 423 r.p.m.

Table feeds 6
From .317″ to 2.79″ per min.

Table .....8½ x 27″
Long. feed (power) 26″.
Vertical feed (hand) 13″.
Trans. feed (hand) 8½″.

Drive .....Single pulley 10 x 3″ running 250 r.p.m.

Gears —..Hardened steel
Weight .....1,500 lb.

We build this same machine with a plain table, omitting the spiral cutting attachment and Dividing Head.

Our No. 1 type machine has a four-step cone drive, and while being a lighter machine is a "bear" for work. This is **proven by** the **hundreds** of **them in** the **largest munitions plants.**

We also build the Fox Multiple Spindle Drilling Machines.

FOX MACHINE COMPANY
1047 W. Ganson St., Jackson, Michigan, U.S.A.

"MARITIME"

9.2 Heavy Duty Single Tool Shell Boring Lathe

SPECIFICATION

Width of bed	20 in.	Rear Bearing	6x5¾ in.
Length of Bed	10 ft.	Driving Pulley	48x8 in.
Length of Carriage on Bed	32 in.	Lead Screw, Diameter	2½ in.
Diameter of Boring Bar	5½ in.	½-inch Pitch, Acme Thread, with Half Nuts	8 in.
Front Bearing	16x6¾ in.		

Long Double Roller, Profile Cam, fitted with Two Steel Rollers 3½ in. diameter. Fitted with Manufacturers Equipment Co. Air Collet.

Note.—Shell is Chucked in Head of Lathe, insuring rigidity, and shortening length of bed to allow minimum floor space.

Profile Boring Bar made to ample dimensions, with single tool, in place of using expensive series of rough and finish Spade Cutters.

Lead Screw is extra large, with Extra Length of Half Nuts, insuring long life of lead screw and nuts, as having a greater wearing surface.

The above Tool is suitable for boring 9.5 in. shells, and would give excellent satisfaction in boring 6 in. and 155 mm., or 8 in. and 220 mm. H. E. Shells.

This machine is driven direct from Clutch Pulley on Line Shaft. We do not supply Clutch Pulley or Countershaft, if same is used.

Manufactured by T. McAVITY & SONS, LTD., ST. JOHN, N.B.

Hammer the Hun Harder

The success of the Allies in this great world-war depends upon the support our munition manufacturers are giving them. Help hammer the Hun harder.

Speed up war orders with

BRADLEY HAMMERS

The Bradley Hammer—powerful, accurate, perfectly controlled—will quicken the action of your plant. It delivers well regulated blows fast, stands tremendous strain and attains big results in many kinds of forging.

This Powerful Hammer is being used extensively in the big arms factories, on heavy duty, producing duplicate parts, a hammer as powerful as the Bradley is essential. These hammers are always under perfect control. Pressure on the foot treadle sets the hammer in motion. As treadle is released a brake stops the hammer.

Let us help you boost your production of government work. Let us know the sort of work you are doing.

CONSERVATION vs. WASTE

OXY-ACETYLENE Welding is proving a great economic factor in the Factories, Mills, Railroads, Mines and Machine Shops of Canada.

Oxy-Acetylene Welding Outfit, employing Prest-O-Lite ready-made Acetylene and compressed Oxygen, both in portable cylinders.

The Nation's scrap pile is one of the worst enemies of Conservation. Hundreds of thousands of dollars' worth of damaged, worn or broken tools, castings, pipe and machine parts lie rusting on the scrap piles of this country. Much of this enormous waste is now being eliminated by Oxy-Acetylene Welding. Losses due to breakdowns—resulting in "tie-ups" of operating equipment—are also being greatly reduced.

Prest-O-Lite PROCESS

is ideal for all classes of metal repair work. It handles repairs quickly and efficiently—often right on the spot—makes broken or worn parts strong as when new—saves time which would be wasted waiting for replacements—abolishes the "Scrap Pile."

The welding outfit is portable—available for outside work as well as for shop use.

No matter what other welding method you now use, a Prest-O-Lite outfit put to work in your shops will quickly pay you profits.

Write NOW for special literature and data that will point out ways to reduce waste and increase efficiency.

Quenching Oil Facts

An Advertisement by Charles E. Carpenter

EVERY practical hardener knows the disappointing features of the old staple oils used for quenching. Linseed, fish, whale, sperm, cottonseed and lard oils all thicken after a short time in use; they throw off objectionable odors, and are difficult to remove from the work.

Frequently these oils are high in first cost, because the price is governed by their general demand throughout the industries, and not by their value for the single purpose of quenching.

Such staples frequently contain excessive *moisture*, which is purchased at full price, but must be boiled off before the oil is fit for service.

And worst of all, these staple oils do not give *uniform* quenching speed when heated to the ordinary temperatures of service, causing variation in the scleroscopic hardness of the metal.

Of late years a special oil for quenching has come into extensive use among the leading concerns manufacturing steel shell forgings, drills, taps, gears, cam shafts, cups, ball and roller bearings, cutlery, machine knives, hack saw blades, circular saws and automobile springs.

This oil, known as HOUGHTON'S No. 2 SOLUBLE QUENCHING OIL, has been found to impart the same degree of scleroscopic hardness as the animal and vegetable oils, and owing to its unvarying quenching speed, it gives more uniformly hardened work. It possesses high refrigerating properties, which impart maximum hardness combined with toughness.

The fractured specimen shows a fine, even, silky grain.

HOUGHTON'S No. 2 SOLUBLE QUENCHING OIL can be used a great length of time without replenishing. It will not thicken in constant use, and is free from unpleasant odor. It has been thoroughly tested and approved by leading metallurgical experts of America and Great Britain, and is recommended by several leading steel companies for heat treatment of their material.

Do not confuse the original HOUGHTON'S No. 2 SOLUBLE QUENCHING OIL, with imitations bearing a similar name; such imitations are inferior.

The price of HOUGHTON'S ranges lower than the normal price of the staple oils. The sooner you start using HOUGHTON'S No. 2 SOLUBLE QUENCHING OIL, the sooner will you begin improving your product and saving money.

Speed, Accuracy, Uniformity in the Heat Treatment of

HIGH-SPEED STEEL

To aim at anything less in this day of super-effort is little short of a calamity. Industry cannot afford to take chances. You will eliminate "chance" if you heat your high-speed steel in a

Tate-Jones Series H Gas Oven Furnace

For temperatures, 1600° to 2400° Fahr. Uses either artificial or natural gas with air at 1½ to 2½ pounds pressure. Radiation loss is exceedingly small, while the recuperative feature effects a saving in fuel of 25% in ordinary work.

This furnace is intended for use in the tool room or for manufacturing uses where it is necessary to harden fine cutting tools of high speed steel. This furnace is scientifically designed and built. It produces a large output of accurate work, and can be depended on where home-made, hit-or-miss methods cannot. Don't guess. Be sure. Use a Tate-Jones Furnace.

Bulletin containing complete information sent upon request. Mention the nature of the work you do and we will send specific information.

THE TABOR MANUFACTURING COMPANY
PHILADELPHIA, PA., U.S.A.

A "fitting" case for your high-grade tools

It's only natural that you wish to keep your tools in a neat, attractive, well-constructed tool case.
Imported cases have nothing on

"EMBREE" TOOL CASES
(17 Styles and Sizes)

in either construction, convenience or price.
Built in quarter cut and plain oak, mahogany. Leather covered with mahogany or oak fronts. Drawers perfectly hand fitted. Oak and mahogany cases dovetailed and highly finished. Mounted in nickle and brass with substantial handle.
No mechanic should be without one
Send for price list.
If your dealer does not carry these in stock write for prices.

Armco Welding Rods

OXY-ACETYLENE ELECTRIC

Make Safe Welding Easy

ARMCO Rods are 99.84 per cent. pure iron and are peculiarly free from the sulphur, phosphorus, slag, oxides and other impurities that ordinarily destroy the homogeneity of the weld.

You would find it decidedly to your advantage to give ARMCO Rods a careful test.

Is Your Product Used In Power Plants?

THERE is a man in every power plant whose influence is felt when a sale is made. Are you on good terms with that man?

Follow the line of least resistance—follow the example of firms who are successfully doing business in the power plant field, and cultivate the engineers through POWER HOUSE.

Ask the first ten engineers you run across just what they think of *their* paper. Their opinions will guide you to an advertising campaign in POWER HOUSE just as surely as though the publishers had directed you. Rates on application.

POWER HOUSE

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

Northern Crane Works, Walkerille.

TURN IDLE TIME TO DRILLING TIME

This is one of the most important factors to consider when selecting machine equipment.

On the NAMCO SIX SPINDLE DRILLER idle time is reduced to a minimum by the use of six drills and twelve work chucks.

Six pieces are extracted and fed while six are being drilled.

NAMCO
Six-Spindle
Driller

The operator need not wait for the drilling to be accomplished.

The drills are in constant operation except for the slight lateral movement of the work chucks.

Minimum idle time means lowered unit costs.

Ask for quotations on **your** work.

Any Cut a Machine Can Pull or a Tool Stand, the Knight Chuck Can Hold

For the Knight Chuck is solidly constructed. Its properly proportioned jaws are the most powerful, and the scrolls are very strong.

Ease of control and adaptability, as well as great gripping power, of course.

OBTAIN THE BEST RESULTS

GARVIN No. 3. Universal Cutter and Surface Grinder. Use Code—Banish.

From Cutters and Tools Kept Sharp on

GARVIN No. 3 UNIVERSAL

CUTTER AND SURFACE GRINDERS

Simple Light Running Accurate

The spindle is hardened and ground and supported out close to the wheel by an extended bearing, and carefully protected from emery.

The knee and the yoke carried on the knee both have a large range of adjustment. On the knee yoke or carriage is mounted the swiveling table, which has a quick, sensitive movement by rack and pinion operated from end or side.

On this table is mounted the index head, and all the attachments are held in this head.

An outfit of emery wheels, mandrels, bushings, wrenches, etc., is supplied with the machine.

Machine is designed to keep its original factory accuracy.

CAPACITY: CUTTERS, 14 in. x 6 in.; SURFACES, 9½ in. x 6 in

Jigs, Tools, Fixtures, Gauges and Special Machinery

WE are production engineers of practical experience in the manufacture of shells and are capable of engineering shell contracts from the laying out of the plant to the shipping of the finished product.

WE design and build special machinery, jigs, tools, fixtures and gauges for the manufacture of shells, guns, gun mounts, trucks, tractors, etc.

Manufacturing contractors for machine parts in quantity.

Send us your enquiries. Our organization is equipped to give you prompt and efficient service.

We Are Specialists In

SHEET METAL STAMPINGS

Equipment---plus Experience

Many difficulties are encountered in stamped and deep-drawn metal work—difficulties that can be successfully overcome only by the skill born of experience. Our staff are accustomed to handling work of every description. They can successfully produce the most complicated work, and their skill is backed by the most modern equipment.

If you require ANYTHING in Sheet Metal Stamping or Deep-drawn Metal Work, let us figure on it.

The Pedlar People Ltd.

Established 1861

Manufacturers of

PEDLAR'S "PERFECT" SHEET-METAL PRODUCTS

Oshawa - Ontario

R.-S. TAPPERS

Column Type Horizontal Tapper

for Faster Tapping and Quicker Assembling

THERE'S THE PROOF—friction drive, absorbing all the shock, allows a chuck speed of 140 r.p.m. on ⅝-in. work—50 per cent. faster than the usual tapping speed for that size. Uses but 1 h.p.

For Minimum Tap Breakage

The smoother drive also reduces the strain on the taps. They wear longer—fewer delays from taps breaking in the work.

For assembling threaded parts (valve stems, spark plugs, instruments, couplings) R.S. Tappers result in quicker assembling and a decidedly larger output from every operator.

Drop a line for full specifications.

MUNITION GAUGES

For Win-the-War Production

A factory that has specialized in gauges, dies, fixtures and special equipment for munition-making since the war began

Service Has Built Up Our Reputation

Our experience is at your command. Consult us about your gauge requirements. We are supplying concerns that are working on all sizes of shells. The demand to-day is for efficiency. The great struggle will admit of no failure.

Should your requirements be of a special character, communicate with us at once. Send us your specifications. We make gauges of all kinds—including thread gauges — used in high speed production.

Your gauges must be dependable. Let us help you put the punch into your work.

Hydraulic Machy. Co., Ltd., Montreal, Que.
MacKinnon, Holmes & Co., Sherbrooke, Que.

PUMPS, AIR
Smart-Turner Mach. Co., Hamilton.

PUMPS, CENTRIFUGAL
Bowser & Co., Inc., S. F., Toronto, Ont.
Can. Blower & Forge Co., Kitchener, Ont.
Can. Ingersoll-Rand Co., Montreal, Que.
Petrie, Ltd., H. W., Toronto, Ont.
Pratt & Whitney Co., Dundas, Ont.
Sheldons, Ltd., Galt, Ont.
Smart-Turner Mach. Co., Hamilton.

PUMPS, FUEL OIL
Bowser & Co., Inc., S. F., Toronto, Ont
Trahern Pump Co., Rockford, Ill.

PUMPS, HIGH PRESSURE
Blake Pump & Condenser Co., Fitchburg, Mass.
Charles F. Elmes Eng. Works, Chicago.
Hydraulic Machy. Co., Ltd., Montreal, Que.
William R. Perrin, Ltd., Toronto.
Smart-Turner Mach. Co., Hamilton.

PUMPS, ALL KINDS
Blake Pump & Condenser Co., Fitchburg, Mass.
Charles F. Elmes Eng. Works, Chicago.
William R. Perrin, Ltd., Toronto.
Petrie, Ltd., H. W., Toronto, Ont.
Smart-Turner Mach. Co., Hamilton.
A. R. Williams Machy. Co., Toronto.

PUMPS, HYDRAULIC
Blake Pump & Condenser Co., Fitchburg, Mass.
Charles F. Elmes Eng. Works, Chicago.
Hydraulic Machy. Co., Ltd., Montreal, Que.
Metalwood Mfg. Co., Detroit, Mich.
Smart-Turner Mach. Co., Hamilton.
William R. Perrin, Ltd., Toronto.

PUMPS, LUBRICANT, OIL
Bellevue Industrial Furnace Co., Detroit, Mich.
Bowser & Co., Inc., S. F., Toronto, Ont.
Fry's (London), Ltd., London, England.
Fulflo Pump Co., Cincinnati, Ohio
Trahern Pump Co., Rockford, Ill.

PUMPS, ROTARY, POWER DRIVEN
Bowser & Co., Inc., S. F., Toronto, Ont.
Trahern Pump Co., Rockford, Ill.

PUMPS, SUD
Fry's (London), Ltd., London, England.

PUMP LEATHERS
Can. B. K. Morton, Toronto, Montreal.
Graton & Knight Mfg. Co., Worcester, Mass.

PUNCHES AND DIES
W. H. Banfield & Sons, Toronto.
E. W. Bliss Co., Brooklyn, N.Y.
Boker & Co., Inc., H., Montreal, Que.
Brown, Boggs Co., Ltd., Hamilton, Canada.
Can. Blower & Forge Co., Kitchener, Ont.
Ferracute Mach. Co., Bridgeton, N.J.
Can. Fairbanks-Morse Co., Montreal.
Gardner, Robt., & Son, Montreal.
A. B. Jardine & Co., Hespeler, Ont.
Marten Machine Co., Hamilton, Ont.
Mulliner-Enlund Tool Co., Syracuse, N.Y
New Metal Tool Steel Co., Sebago Lake, Me.
Petrie, Ltd., H. W., Toronto, Ont.
Petrie of Montreal, Ltd., H. W., Montreal, Que
Pratt & Whitney Co., Dundas, Ont.
Stoll Co., D. H., Buffalo, N.Y.
Toledo Machine & Tool Co., Toledo, O.

PUNCHES, POWER
John Bertram & Sons Co., Dundas.
E. W. Bliss Co., Brooklyn, N.Y.
Brown, Boggs Co., Ltd., Hamilton, Canada.
Canada Machinery Corp., Galt, Ont.
Consolidated Press Co., Hastings, Mich.
Ferracute Mach. Co., Bridgeton, N.J.
A. B. Jardine & Co., Limited, Hespeler, Ont.
Niles-Bement-Pond Co., New York.
Stoll Co., D. H., Buffalo, N.Y.

PUNCHES, CHROME, VANADIUM SHELL
Hammond Steel Co., Inc., Syracuse, N.Y.

PUNCHING MACHINES, HORIZONTAL
Bertrams, Ltd., Edinburgh, Scotland.
John Bertram & Sons Co., Dundas.
Canada Machinery Corp., Galt, Ont.
E. W. Bliss Co., Brooklyn, N.Y.
Brown, Boggs Co., Ltd., Hamilton, Canada.
Niles-Bement-Pond Co., New York.
W. A. Whitney Mfg. Co., Rockford, Ill.

PYROMETERS
Bellevue Industrial Furnace Co., Detroit, Mich.
Bristol Co., Waterbury, Conn., U.S.A.
Can. Hoskins, Ltd., Walkerville, Ont.
Holz, Herman A., 1 Madison Ave., New York.
Shore Instrument & Mfg. Co., New York City
Taylor Instrument Co., Rochester, N.Y.
Thwing Instrument Co., Philadelphia, Pa.

QUARTERING MACHINES
John Bertram & Sons Co., Dundas.
Niles-Bement-Pond Co., New York.

RAILING, IRON AND BRASS
Can. Welding Works, Montreal, Que.
United Brass & Lead, Ltd., Toronto, Ont.

RAIL BENDERS
Niles-Bement-Pond Co., New York.

RAILROAD TOOLS
Can. Fairbanks-Morse Co., Montreal.
Niles-Bement-Pond Co., New York.

RAIL OVERHEAD
Morris Crane & Hoist Co., Herbert, Niagara Falls, Ont.

RATCHETS
Keystone Mfg. Co., Buffalo, N.Y.

RAW HIDE PINIONS (SEE GEARS)

REAMER FLUTING MACHINES
Garvin Machine Co., New York.

REAMERS, ADJUSTABLE
Can. Fairbanks-Morse Co., Montreal.
Cleveland Twist Drill Co., Cleveland.
Kelley Reamer Co., Cleveland, Ohio.
Morse Twist Drill & Mch. Co., New Bedford, Mass.
Osborn (Canada), Ltd., Sam'l, Montreal, Que.
Plewes, Ltd., Winnipeg, Man.
Pratt & Whitney Co., Dundas, Ont.
Standard Machy. & Supplies, Ltd., Montreal, Que.
Taylor, J. A. M., 318 Stair Bldg., Toronto, Ont.
Whitman & Barnes Mfg. Co., St. Catharines, Ont.
Wilt Twist Drill Co., Walkerville, Ont.

REAMERS, BRIDGE, EXPANDING AND HIGH-SPEED
Aikenhead Hardware Co., Toronto.
Baxter & Co., Ltd., J. R., Montreal, Que.
Boker & Co., Inc., H., Montreal, Que.
Butterfield & Co., Rock Island, Que.
Can. Fairbanks-Morse Co., Montreal.
Clark Equipment Co., Buchanan, Mich.
Cleveland Twist Drill Co., Cleveland.
Illinois Tool Works, Chicago, Ill.
Kelley Reamer Co., Cleveland, Ohio.
Morse Twist Drill & Mch. Co., New Bedford, Mass.
McKenna Brothers, Pittsburgh, Pa.
New Metal Tool Steel Co., Sebago Lake, Me.
Osborn (Canada), Ltd., Sam'l, Montreal, Que.
Pratt & Whitney Co., Dundas, Ont.

REAMERS, PIPE, CYLINDER AND LOCOMOTIVE
Butterfield & Co., Rock Island, Que.
Can. Fairbanks-Morse Co., Montreal.
Cleveland Twist Drill Co., Cleveland.
Kelley Reamer Co., Cleveland, Ohio.
Morse Twist Drill & Mch. Co., New Bedford, Mass.
Petrie, Ltd., H. W., Toronto, Ont.
Pratt & Whitney Co., Dundas, Ont.

REAMERS, STEEL TAPER AND SELF-FEEDING
Butterfield & Co., Rock Island, Que.
Can. Fairbanks-Morse Co., Montreal.
Clark Equipment Co., Buchanan, Mich.
Cleveland Twist Drill Co., Cleveland.
Illinois Tool Works, Chicago, Ill.
Kelley Reamer Co., Cleveland, Ohio.
A. B. Jardine & Co., Hespeler, Ont.
Morse Twist Drill & Mch. Co., New Bedford, Mass.
Petrie, Ltd., H. W., Toronto, Ont.
Pratt & Whitney Co., Dundas, Ont.

REAMING MACHINES, PNEUMATIC
Cleveland Pneumatic Co. of Canada, Toronto.
Garlock-Walker Machinery Co., Toronto, Ont.

RECORDING INSTRUMENTS
Bristol Co., Waterbury, Conn.
Taylor Instrument Co., Rochester, N.Y.

REGULATORS, PRESSURE, TEMPERATURE
Can. Fairbanks-Morse Co., Montreal.
Taylor Instrument Co., Rochester, N.Y.

RESPIRATORS
Strong, Kennard & Nutt Co., Cleveland, Ohio.

RIVETS, TUBULAR, BIFURCATED
Parmenter & Bulloch Co., Gananoque.
Rice, Lewis & Son, Toronto, Ont.
Steel Co. of Canada, Ltd., Hamilton, Ont

RIVETS, IRON, COPPER AND BRASS
Aikenhead Hardware Co., Toronto, Ont.
Harvey & Co., Arthur C., Boston, Mass.
Parmenter & Bulloch Co., Gananoque.
Rice, Lewis & Son, Toronto, Ont.
Steel Co. of Canada, Ltd., Hamilton, Ot.

RIVETERS, PNEUMATIC, HYDRAULIC, HAMMER, COMPRESSION
Can. Fairbanks-Morse Co., Montreal.
Can. Ingersoll-Rand Co., Montreal.
Cleveland Pneumatic Tool Co. of Canada, Toronto
Garlock-Walker Machinery Co., Toronto, Ont.
Independent Pneumatic Tool Co., Chicago, Ill.
Niles-Bement-Pond Co., New York
Petrie, Ltd., H. W., Toronto, Ont.

RIVETING MACHINES, ELASTIC ROTARY BLOW
Grant Mfg. & Machine Co., Bridgeport, Conn.
High-Speed Hammer Co., Rochester, N.Y.
F. B. Shuster Co., New Haven, Conn.

ROLLER CHAINS
Can. Link-Belt Co., Toronto, Ont.
Jones & Glassco, Montreal.

ROLLS, BENDING AND STRAIGHTENING
John Bertram & Sons Co., Dundas
Brown, Boggs Co., Ltd., Hamilton, Canada.
Canada Machinery Corp., Galt, Ont.
Niles-Bement-Pond Co., New York
Toledo Machine & Tool Co., Toledo, O.

ROLLS, CRUSHING
Can. Link Belt Co., Toronto.

ROOFING, METAL
Pedlar People, Ltd., Oshawa, Ont.

RUBBER MILL DRIVES
Can. Link-Belt Co., Toronto, Ont.

RUBBER MILL MACHINERY
Bertrams, Ltd., Edinburgh, Scotland

SAW MILL CONVEYORS
Can. Link-Belt Co., Toronto, Ont.

RULES
Brown & Sharpe Mfg. Co., Providence
James Chesterman & Co., Ltd., Sheffield, Eng.
Rice, Lewis & Son, Toronto, Ont.
L. S. Starrett Co., Athol, Mass.

SAFETY APPLIANCES
Strong, Kennard & Nutt Co., Cleveland, Ohio.

SAFETY APPLIANCE GOGGLES
Willson Co., Inc., T. A., Reading, Pa.

SAND BLAST ABRASIVES
Pittsburgh Crushed Steel Co., Pittsburgh, Pa.

SANDING MACHINES
Canada Machinery Corp., Galt, Ont.

SAND BLASTING MACHINES
Richards Sand Blasting Machine Co., Montreal, Que.

SAW MILL MACHINERY
Can. Fairbanks-Morse Co., Montreal.
Canada Machinery Corp., Galt, Ont.

Showing Class "B" Hindman High Duty Shell Turning Lathe equipped with Air Chucks.

Class "B" Hindman High Duty Shell Turning Lathe

Under ordinary working conditions, in a large Middle Western munition plant, it was found upon investigation that at 30 feet cutting speed, Class "B" Hindman High Duty Shell Turning Lathes easily handled an average of six shells (155-mm. Class "B" Steel) per hour—thirty shells were turned on original grinding of the tools before regrinding was necessary.

Further investigation revealed the startling fact that with the use of proper tool steel, these lathes rough turned 155-mm. shells at a cutting speed of 60 feet per minute with a feed of 100-1000 per revolution, an actual cutting time of 6¼ minutes per shell.

The Class "B" Hindman High Duty Shell Turning Lathe is unequalled for the heavy work encountered in shell turning, simply because it is especially built for that purpose. It is a re-designed model of the well-known and widely approved Class "A" Hindman 20-inch High Duty Lathe which is widely used by the leading munition makers of the world, such as—

Westinghouse Companies, American Car & Foundry Company, General Electric Company, Ingersoll-Rand Company, Union Switch & Signal Company, Minneapolis Steel & Machinery Company, Milton Manufacturing Company, Canadian Fairbanks-Morse Company, Briscoe Motor Corp., and Rolls-Royce, Ltd., of Derby, England.

These Lathes are powerful enough to rough turn with a cut of ½ inch deep at any speed the tool steel will stand. They can be used for finished turning operations by omitting first set of gears in headstock, and attaching belt pulley to back gear pinion shaft.

Bulletin 102 is just off the press, and gives complete description. Write for it.

The Duff Mfg. Company, Pittsburgh, Pa.

Established 1883

Illustrating Class "B" Hindman High Duty Shell Boring Lathe. Note large diameter of hole in spindle.

Class "B" Hindman High Duty Shell Boring Lathe

The Class "B" Hindman High Duty Shell Boring Lathe is of the same general construction as the Class "B" Hindman High Duty Shell Turning Lathe. The Boring Lathe, like the Turning Lathe, is a redesigned and improved model of the Class "A" Hindman 20-inch High Duty Lathe, so widely used in the production of munitions.

The spindle has a 7½-inch hole and a depth of 25 7/16 inches, which permits 155 mm. and six-inch shell forgings in the rough to be admitted into it practically full length. This permits a shorter bed, thus saving floor space, eliminates the use of pot chucks, and permits the rough Boring operation before the rough Turning operation, if desired. The front of the spindle is so designed that large set screws can be used to hold shell instead of chucks.

Furnished regularly with a six-way turret of simple construction and provided with a powerful and rigid clamp over the entire surface of the turret base sufficient to hold the turret against play under the heaviest cuts. The turret head is a steel casting of ample size to withstand all strains of heavy cuts and failure of tools. Rapid traverse forward and reverse is provided. This boring Lathe can be modified to take saddle arranged for single boring bar, controlled by a "Former," or can be arranged to carry a tailstock boring bar with power feed to tailstock.

Bulletin 102 describes Class "B" Hindman High Duty Shell Turning and Boring Lathes in detail. Write for it.

Anybody Can Operate This Miller

and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

Heavy Duty Engine Lathes

Built to withstand the shocks and strains of heavy work. Hundreds in use in Canada and United States boosting munition production.

The Sidney Line includes a high grade 15 inch machine suitable for Tool Room work, as well as for light manufacturing on a rapid production scale. Also a 17 inch Lathe suitable for heavy duty, rapid production manufacturing and for turning, boring and finishing shells up to and including 3 inch sizes. A 19 inch machine which will work shells up to and including 4 inch sizes.

The Sidney 25 inch Lathe, illustrated on this page represents the latest improvements in lathe construction. This machine also built with 27 inch swing.

NEW BULLETINS JUST ISSUED ON 25 INCH MACHINE.

Schieren Belt Advertising Campaign a Record Breaker

In the Face of New Competition, the Advertising is Completely Organized and Carried with Great Strength to Each Industrial Field

Reprint of an article appearing in Printers' Ink, July 11, 1916

THIRTY-EIGHT per cent. of the leather belting sold by the Chas. A. Schieren Company, of New York, is on its highest grade brand—the only one of seven grades that it advertises. A generation ago this brand was unknown by any other name than waterproof tanned oak leather belting. To-day it is generally recognized throughout the industrial field as Duxbak.

And yet for all the fifteen or more years that Duxbak has been advertised, it was not until last year that a definitely formulated campaign was laid out for a season ahead.

During the past year this campaign has been under way, the largest ever undertaken by any manufacturer in strictly industrial and technical papers. It now plans to carry on the drive along the same lines through another year.

The Charles A. Schieren Company, of New York, is not a young concern, it might be termed middle-aged. It celebrated its fiftieth birthday last year. But its years haven't made it seedy, it is not taking its place with the unprogressive houses, instead it is finding its gait and might be called a truly progressive concern. Its advertising history shows step by step its advance toward economical and progressive marketing, culminating, as it does, in the largest advertising campaign of its kind to meet competition.

It started to advertise along about twenty or thirty years ago—the usual humdrum trade-paper cards, making the astounding statement that it made oak tanned leather belting. It did not even have a trade-mark.

About fifteen years ago Mr. Schieren decided that "oak tanned leather belting" did not distinguish his products from the others sufficiently. So he decided to trade-mark some of his grades, particularly with an eye to advertising his highest quality belt. This is a belt processed to make it waterproof. Heretofore not much had been said in the copy about this particular grade or its features. The company has a letter from a customer written about thirty years ago, saying that he wanted another of the company's waterproof belts, but even with this hint for a talking point, nothing had been made of it.

But when it came to the point of trade-marking the brand, Mr. Semple, of the Hill engineering weeklies, who was one of the first to handle the advertising, was asked to get up a name. Among several submitted Duxbak was the one chosen, bringing up, as it does, the idea of proof against weather. The trade-mark of a duck's outline with the name lettered across it followed later. Mr. Semple purchased a duck and kept it in his cellar until he had a drawing which he considered anatomically correct.

This was the first time that anything like a definite idea found its way into the Schieren copy, and for years the plan of operation was to play up the new trade-mark as much as possible. Later on the company ran a series of cartoon advertisements, occupying quarter-pages in the industrial and technical publications. This was backed up with front covers. Mr. Schieren was a firm believer in them and would advertise in almost any paper if he could get the front cover.

This hit-and-miss plan of advertising was sufficient unto itself for the time being. Didn't leather belting control the field? Wasn't Schieren's belting being kept before the minds of the buyers? Weren't the salesmen bringing in sufficient orders for the company to enjoy a healthy growth?

Then from out of a clear sky chaos broke. The competitors of leather belting, namely, the direct drive, rubber, composition and fabric belts began to push their products as never before. The time was ripe—the prices of leather belting, due to war conditions, were mounting higher and higher. New shops were going up all over the country. New shops meant coil after coil of belts. Leather substitutes were sell-

Continued on page 144.

The Needs of the Empire

NEVER BEFORE in the history of Canada has greater opportunity been offered her Sons and Daughters to render SERVICE to the Empire;—and

NEVER BEFORE have the needs of the Empire demanded as high a standard of QUALITY in thought, deed and product as at present.

HOW NOBLY CANADA has responded is now known around the World and history will record it for the future.

THE PRODUCTS OF OUR MILLS are at the Fronts and on the Seas, in the Shipyards and Factories and in the Fields, faithfully fulfilling their mission of reliable performance wherever the Government's War-Winning Programme directs, as we are, and have been, stripped for action since the first call to arms.

THE NEEDS OF THE EMPIRE are many and the War-Winning Programme changes as necessity demands; but it matters not, the needs of the Empire are paramount and must be supplied.

THEREFORE, if in these trying times, we do not deliver promptly to you such of the products of our Mills or Blast Furnaces as you may need, console yourself with the thought that through us, you are rendering Service to the Empire and to the Cause that matters most for the Liberty, Justice and Freedom of the World.

BRIDGEFORD

Heavy Duty Boring and Turning Lathe

Boring a 6-in. Hol- 18ft. long in 6 Hours

The 32-in. Bridgeford Lathe shown above was installed in the plant of the Pittsburg Forge & Iron Co., for both heavy duty boring and turning. The machine is motor driven, equipped with two carriages with apron control of motor, and fitted with power feed Boring Tailstock in addition to regular tailstock.

One of their recent jobs was the boring of piston rods, material running 40 to 50 point carbon, annealed stock.

The diameter of the holes bored was 6 inches and the length 18 feet. These holes were bored in 6 hours, making the average time 3 feet per hour and removing approximately 285 lbs. of metal per hour.

We have other interesting data on the performance of these machines, which will be sent on request, together with your copy of the Bridgeford Catalogue.

If You Need a
POWER HAMMER

of uncommon strength throughout — a hammer constructed to deliver work of surpassing quality in great quantity, and to keep everlastingly at it—

You Need Jardine's

Note a few particulars:

Hammer slide is a steel casting: so is the ram, and connecting bolts for the ram are machined from solid steel bar.

Hammer and anvil dies of properly tempered, highest grade tool steel are held in machine seats by tapered keys in the ram and anvil block, so there's no need to put taper on the dies.

Jardine's Canadian Giant Power Hammer has never failed.

Economy in Metal Cutting

is accomplished by using Nutter & Barnes machines. They are strong, high-powered, speedy and easily controlled.

Special features are: Single lever control for stopping and starting feed, four speed changes, a system for forced lubrication which always delivers the oil at the cutting point, and a friction safety device to prevent overfeeding.

Greenfield Tap and Die Corporation
GREENFIELD, MASSACHUSETTS, U.S.A.
Canadian Agents, Wells Bros. Co. of Canada, Ltd., Galt, Ont.

IT is a national necessity at present for Canada to improve her trade balance with the United States.

Manufacturers who are buying forgings or drawn or stamped metal parts outside of Canada can do something towards helping this trade balance by calling upon us for these goods.

We are equipped to make practically anything in a steel forging or steel stamping. Our capacity is so large that we can give prompt delivery; and our efficiency is such that we can quote you attractive prices for high class work.

Dominion Forge & Stamping Co., Ltd.
WALKERVILLE, ONTARIO
Toronto Office: 510 Lumsden Building

Roelofson Banding Machine

for 75 mm. and 155 mm. Shells.

Excellent Delivery

Our manufacturing facilities are such that we can make excellent delivery on machines for the above sizes. To shell plants changing over to the 75 mm. and 155 mm. shells this should be of especial interest.

Experimenting in Munition Making is Past

AND likewise experimenting in munition machinery is past. The "experiments" are all in the discard and only the machines properly designed and carefully built have survived.

Roelofson Band Turning Machines have stood up consistently under three years of the severest service possible. They have met every requirement of production and serviceability and are still doing duty in many Canadian munition plants.

Don't experiment with your 75 mm. and 155 mm. shells. Use the machine that has a record of three years of service behind it.

Note these features of construction:

Integral (en bloc) construction assures perfect rigidity, permanent accuracy and desirable compactness.

Chucking with spring collet chuck insures accurate and speedy chucking.

Graduated feed dial, two cutting tools, and ample belt power insure output of accurate work in least possible time.

Machines are also built for 15, 18, 60-pdr. and 6-in. shells.

ELECTRITE

High Speed Steel

SEVERAL factors combine to make this high-speed steel a triumph of the steel-maker's art: Electric Furnaces—entirely infallible, automatically regulated, delivering the same result time after time.

Uranium—this rare element, cousin to Radium, effects a profound change in the texture and quality of the steel.

Added to these, the constant care and skill of years of steel-making experience make the result of each melt a foregone conclusion.

"SIDNEY"

For Service

SYDNEY LATHES MAKE TOUGH JOBS LOOK "SOFT"

They take deep cuts through the toughest metal without pause or chatter.

Specifications include 3-step cone, double back gear, semi-quick-change gear lathe, built on 10-ft. bed. This lathe also furnished with quick-change gears. Bed lengths available, 10, 12, 14, 16, 18 and 20 ft.

Sydney Lathes are made in 16-inch, 17-inch, 19-inch, 25-inch and 36-inch sizes. Their duties ranging from the finest tool room work to the heaviest munition plant rapid production work.

Nova Scotia Steel & Coal Company

Limited

New Glasgow, Nova Scotia, Canada

THREE AND ONE-HALF AND FIVE-TON "FLUID COMPRESSED" STEEL INGOTS.

The Nova Scotia Steel & Coal Co., realizing the importance of "fluid compression" as a valuable aid in producing reliable and first-class steel products, procured by purchase the Canadian license from M. Harmet, of St. Etienne, France, whereby they own the sole rights in this Country to use his process. This they considered in accordance with their policy of taking advantage of every important metallurgical development, thus advancing with modern progress, and particularly that their high reputation as manufacturers of the best marine, railway and machine forgings obtainable should be maintained.

The "fluid compression" plant laid down at Sydney Mines, N.S., consists of one group of four Harmet presses, each of 1,250 tons and capacity to handle 3½ to 5-ton ingots; and one of 4,000 tons to handle ingots up to 30 tons.

The product of this process is used in the manufacture of high-grade forgings, such as locomotive axles, crank shafts, marine forgings, artillery tubes and armor plate of the highest grade; in fact for all commodities in which maximum reliability and homogeneity of structure enter and are demanded.

Cutting Speed on This Job 70 Feet Per Minute

That speed is being obtained on a heavy cut in steel, with a

Whitcomb-Blaisdell Planer

The Planer with the Second-Belt Drive

The smooth, easy action and rapid, yet gentle, reverse required for such rapid cutting rates is secured by the distinctive table-drive of the Whitcomb-Blaisdell Planer.

There are many other Whitcomb-Blaisdell Planers operating at similar high speeds in steel. In numerous cases they are planing brass, copper and other soft materials at one hundred feet per minute.

The Second-Belt Drive—using a belt and pulley to convey power from the pulley shaft to the drive-pinion shaft—eliminates the usual bull wheel and the rapid running train of gears.

On the Whitcomb-Blaisdell Planer, the table is given a smooth, quiet, yet powerful drive. At the end of the stroke the belt transmission acts with a cushion effect and the planer reverses without shock or jar, yet with the utmost speed.

That is one reason why this machine attains the highest speeds without impairing the accuracy or finish of the work.

Write for Illustrated Catalog that tells all about it.

The big features of this machine will be of interest

LATHES PLANERS

If what you need is not advertised, consult our Buyers' Directory and write advertisers listed under proper heading.

MAGNETIC CHUCKS

The J. N. Lapoint Company, New London, Conn., use our chucks for work that requires all the "hold" a magnetic chuck can deliver—chucking long broaches for planing. They butt together two chucks of the rectangular type, lay on the broaches, start operations and take the last cut without a slip.

HEALD MAGNETIC CHUCKS hold against the long drawn out pull of a planer in a way that proves their worth. They are in general use on milling machines, grinders, shapers in tool rooms and for manufacturing. They help a machine reach its highest efficiency by reducing setting up time to a minimum.

Heald Chucks Hold—*Always*

In many cases a change to this method of chucking has doubled production. Our Engineering Department will be glad to make recommendations for chucking *your* work. Write us—there is no obligation.

COMPARISONS MAY BE ODIOUS

—yet it is largely through them that progress takes place.

The prompt adoption of labor-saving devices, more efficient methods, improved machinery—this is what distinguishes the leaders from the trailers in every branch of industry.

Screw machine users are invited to send us samples or prints of their work. Estimates of "six-spindle" production will be submitted for comparison with present output.

It's an unusual job on which the "New Britain" cannot show an increased production of at least 50%. And cases are far from rare where it is producing 200% above previous records.

"Compare Productions"! It pays.

PETRIE Heavy Duty Manufacturing Lathe—*20-Inch Swing*

A Heavy Simplified Lathe for Rapid Production Work

Designed and built especially for Machining High Explosive and Shrapnel Shells up to and including 8-inch. Used and Endorsed by many of the Largest and Most Successful Shell Manufacturers.

DESCRIPTION

HEADSTOCK All Headstock journals are provided with well lubricated, renewable bronze bearings. Alternat heat treated steel and bronze washers take the end thrust and a simple adjustment is provided to take up wear. All gears are covered with neat and substantial cast iron guards that may be quickly removed when desired.

BED The Bed is of deep construction and width to give the greatest rigidity under heavy cuts. The shears are made extremely massive and the bed walls extra thick, providing the necessary mass of metal to absorb the vibration and shocks incident to heavy turning at high speeds. Heavy box girths tie the front and rear walls of the bed together at close intervals. Improved type wide angle V on front shear to take thrust of cutting tool. The rear bearing of carriage on bed is flat instead of V-shaped. At the rear of the bed planed pads are provided for attaching Taper and Forming Attachments.

CARRIAGE The bridge is very wide and extraordinarily deep; it will not spring under the heaviest cuts. The carriage is gibbed to the bed at the rear on the outside and will not lift under any conditions.

APRON The apron is of heavy double plate type affording a support or bearing to both ends of all shafts. Apron is tongued and grooved to the carriage, also bolted and dowelled. The feed friction has a greatly increased diameter and will pull the heaviest feeds and cuts without slipping. For engaging the friction a hand wheel several inches in diameter is provided and seats the friction firmly with very small effort on the part of the operator. All studs in apron revolve and simple but adequate oiling facilities are provided.

FEEDS Positive Gear drive through headstock spindle, steel gears in gear box, three rates of feed are provided for through sliding key type. Feeds per revolution of spindle being 1/8 in., 1-16 in. and 1-32 in. All gears in the feed train are fully guarded.

TAILSTOCK The tailstock is a massive casting, rigidly braced internally, and is provided with a long nose, making it unnecessary to extend the tailstock spindle for ordinary work. It is clamped to the bed by four large locking bolts operated at the top of the barrel. A simple binder locks the tailstock spindle in correct alignment; this clamp is located at the extreme front end, where it grips the spindle with the utmost rigidity and absolutely does away with distortion of any kind. The screw is unusually large to resist any buckling tendency. Suitable screws are provided for setting over for Taper Work.

EQUIPMENT Unless otherwise specified Lathes are furnished with 8 ft. bed, one driving plate, hand cross feed, heavy duty plain rest, necessary wrenches, and two-speed tight and loose countershaft. Forming attachment, turret tool post, hand or power feed bed turret, oil pan, pump, and connections can be furnished as extras when desired.

DIMENSIONS

Swing over bed	20 in.
Swing over carriage	11 in.
Length of Bed Standard	8 ft.
Distance between centres 8 ft. bed	40 in.
Width of bed overall	19½ in.
Height from floor to centres	40 in.
Dimensions of front spindle bearing	4 15/16 in. x 6¾ in.
Dimensions of rear spindle bearing	4 in. x 5½ in.
Diameter Nose of spindle	4 in.
Hole through spindle	1 5/16 in.
Diameter Tailstock spindle	3⅜ in
Travel of Tailstock spindle	6 in.
Morse Taper—Centers	No. 5
Width of Tool Slide	12 in.
Diameter of Headstock Cones	11 in. and 14 in.
Belt Width	6 in.
Number of Feed Changes	3
Feeds per Revolution of Spindle	⅛ in., 1/16 in., 1 32 in.
Speed of Countershaft	110 R.P.M.
Size of Tight and Loose Pulleys	16 in. x 6¼ in.
Ratio of Back Gearing	6.7 to 1
Face of Back Gears	2¾ in. and 2¼ in.
Length of Carriage Bearing	30 in.
Width of Carriage Bridge	12 in
Number of Spindle Speeds with Two-Speed Countershaft	8
Weight—Approximately, 8 ft. Bed	5,800 lbs

GRATON & KNIGHT

Standardized Series

LEATHER BELTING

Tanned by us for belting use

L. J. HOOVER, President & Gen'l. Mgr. W. A. STIVERS, Vice President. M. J. FRITZ, Treasurer. M. D. RUNCIMAN, Secretary.

HOOVER STEEL BALL COMPANY

ANN ARBOR, MICH Dec. 31, 1917.

The Graton & Knight Mfg. Co.,
264 E. Jefferson Ave.,
Detroit, Mich.

Gentlemen:-

We have practically eliminated all other leather belting from our works and are using Spartan Belting entirely on the Dry Grinders, which place we are sure is the most severe use for leather belting there is in the State of Michigan.

We have been experimenting with leather belting for the past three years to get a belt that would give us service. We have not limited ourselves to price on this belt. For this purpose the life of the belt ordinarily is short, therefore, it is our desire to buy the best belting that we can possibly obtain, regardless of price.

Our Engineer has advised us that Spartan Belting has in every way met with our expectation and this has reduced our belt expense approximately 40% within the past fifteen months. Within the past twelve months we have discontinued using all other makes and are using this Spartan Belt entirely as it has been the belt which has stood up for this particular purpose.

Very truly yours,

HOOVER STEEL BALL COMPANY.

L.J. Hoover

President and General Manager.

LJH:EH

GRATON AND KNIGHT

"the most severe use of leather belting" (see letter)

The advantages of standardized belting stand out *most conspicuously* in severe use, but they are *just as truly present* in less exacting conditions. Dollars are valuable whether you save them by tens or by hundreds.

The steps in acquiring transmission-wisdom run somewhat as follows: A poor belt is better than none at all. A good belt is better value than a poor one. But the scientifically right belt for each machine is the highest economy of all—and that is Standardization. It also explains why there is greater demand for Graton & Knight Standardized Series Leather Belting than for any other brand in the world.

Volume XX. No. 5. August 1, 1918

Promotion the Real Way to Keep Employees

The Employment Department of Any Organization Should Seek to Pass on Only the Most Suitable Applicants to Departments Where Openings May Have Occurred—How the Work Can be Co-ordinated

By M. H. POTTER

THE raising of the standard of efficiency of the working force, individually and as a whole, in order that the purchasing power of the wage-dollar may be increased, is the broad function of the employment department. The employment department is the department whose duty it is to develop the efficiency of the workers, directly or indirectly, and to bring about a condition in which the individual employee will render as nearly as possible 100 per cent. to his employer.

Personal efficiency is composed of various proportions of brains, health, instruction, loyalty, enthusiasm, ambition, ability to co-operate, personality and character. This purpose can best be served through a centralized employment department, under a manager reporting directly to the general manager of the company—a department composed of four divisions, as follows: first, the employment division, which assumes the task of selecting and engaging the help; second, the medical division, whose function, of course, is to see to the physical health of the employees; third, the instruction division, through which the employees are given the opportunity to increase their special ability and training; fourth, the welfare division, whose purpose is to create a favorable mental background for the workers. Let us consider these divisions in order.

Employment Division

It is the duty of the manager of the employment division to keep in touch with the sources of labor supply and engage workers best qualified to fill the vacancies occuring in the organization. These vacancies are reported to it on labor requisitions received from the executives of the operating departments. When a mechanical engineer constructs a machine, he naturally exercises the greatest care as to the quality of the material he puts into it. Similarly, when a human engineer is constantly at work building up an efficient working force, he must use the best care and discrimination in choosing the units which are to comprise it. Subsequent training is indispensable and frequently is instrumental in transforming unpromising employees into efficient workers; but the value of the training is greatly increased when it is applied to responsive material and the result is much better.

The employment office file in which are classified by kinds of work the application blank filled out by individuals who have called seeking employment, is the most fruitful source of supply. Quite naturally, for every position that is open there are several applicants. Only one can be selected for the particular vacancy, but among the others are invariably several who are well qualified for consideration when other vacancies occur.

Another source of supply is that represented by the payroll. Whenever a position of any importance is to be filled, by going through the present organization there will be found persons who can be promoted to that position.

Of course, splendid material for stenographic and clerical work can usually be obtained from the high schools, the principals of which are naturally interested in placing their graduates. Similar material of a clerical nature can often be obtained from the various typewriting agencies who, in a similar way, are interested in placing their clients.

As a rule there are several employment bureaus of the city always at service, but owing to the nature of their clientele, much undesirable material passes through their doors. Too many bureaus of this kind operate in a mechanical way, without giving the vocational guidance to which applicants are entitled. Too frequently they feel their duty is done when they give an applicant a letter of introduction to an employer regardless of whether or not he is particularly equipped for the employer's service or whether he is accepted.

A vast quantity of material is available through the classified advertising columns of the newspapers. Advertising of this kind naturally brings a certain proportion of applicants who are hopelessly unfit, but these can be rapidly eliminated and desirable applicants retained for more complete analysis and examination. Except where immediate action is needed, the blind advertisement is more satisfactory than the advertisement which mentions the employer's name. Blind advertisements automatically eliminates much of the hopeless material and enable the manager of the employment division to exercise preliminary judgment by analyzing the letters received from the applicants.

Applicants for positions are shown into an anteroom, where those who are obviously undesirable are weeded out. Those who deserve further consideration are requested to fill out application blanks which, when complete, show their age, their previous business experience, the names of their previous employers, the length of their service and their reasons for leaving those employers, their previous salary and the salary expected, and the names of references. Each of these blanks is delivered to the manager of the employment division, who thus has a chance to analyze each applicant's previous experience before the applicant himself is shown into the managers 'inner office.

Doubtless each employment manager has his own particular system of sizing up applicants. Immediately after the interview or during it, the manager of the employment division fills out one of our analysis cards with which it is possible to mentally reconstruct the applicant at any future time, in order to consider him for any later vacancy, if he is not employed immediately. The

analysis cards contain eight divisions, as follows:

Personality.
Build.
English.
Type of mind.
Executive.
Detail.
Promotive.
Mechanical.
Analytical.
Appearance.
Mentality.
Super alert.
Alert.
Average.
Slow.
Dull.
Initiative.
Remarks.

The phrases explain themselves. Let us assume that a certain applicant has called at the employment office, has filled out an application blank, has been interviewed by the manager of the employment division, and has passed satisfactorily. The applicant is then conducted to the executive of the operating department for whom he has been secured, and is interviewed by that executive, whose decision is final. If the applicant similarly satisfies the operating executive, he is then sent back to the employment division and examined by the physician in the medical division. If the physican gives him a clean bill of health, the employee s then told where and when to report by the employment division, is given final instructions, and is made to feel as much at home as possible.

Letters of inquiry are then sent to the persons named as references by the applicant. The value of these references is moral rather than practical, as few employers will voluntarily stand in the way of an ex-employe of theirs securing employment elsewhere.

If the applicant should be rejected by the executive in the operating department, he is similarly sent back to the employment division, where he is either placed elsewhere in the organization or told that his aplication will be considered snould any other vacancies arise for which he is qualified. Occasionally the judgment of the manager of the employment division and the operating executive will differ in this way; yet the employment department never makes an issue of such a case or endeavors to force an employee upon an unwilling executive. Such an issue would not only be bound to arouse antagonism on the part of the operating executive, which in turn would be fatal to harmonious and efficient work on the part of the employment department, but it would also fail of its purpose, inasmuch as whether or not the operating executive has the legislative activity to reject an applicant recommended by the employment department, he at least has the ability to make things so unpleasant for the new employee that he would willingly resign.

However, the engaging of help is not the complete function of the employment department. This division similarly acts as a clearing-house of labor between department and department and makes possible a condition in which one department may be laying off help while another department of the same company is engaging help of the same character. It is obligatory upon the employment division also to keep as accurate a report as possible of the performance of employers and to transfer those who are misplaced to other positions for which they are better fitted by temperament. An employee who works at his job because he is fitted for it, because he enjoys it, and therefore, puts enthusiasm into his work, is worth far more to his employer than the worker who works indifferently at his job only because he is paid for it and who quits as on principle immediately on the stroke of the bell.

Medical Division

The work of this division dovetails somewhat with the work of the employment division. The hospital consists of a waiting room, an outer office, where bandages are applied and minor injuries treated by the orderlies, and the inner office, where the doctor holds his examinations. An orderly is in attendance both day and night and a physician is in attendance every afternoon. Two nurses are constantly in attendance at the women's hospital during the day and night.

Instruction Division

Three good-sized rooms, well-lighted, comprise the quarters of the instruction division. Instruction is the process of training a new employee capable of delivering perhaps 10 per cent. service into a trained worker capable of delivering 90 per cent. service or better. Methods of this training differ with different concerns. Some concerns, owing to the nature of their work, find it best to maintain schools, under salaried teachers, for this purpose. Other concerns have their instruction work done departmentally by persons designated to that task or even by foremen and fellow employees. Where the instruction work is done in this way, the employment department should be an interested party. It should either exercise direct control or a strong advisory influence.

Welfare Division

The work of this division has direct reference to the state of mind of the employee. This division of the work is founded on the certainty that an employe who is happy and satisfied and free from anxiety and who works under favorable physical conditions will do better work and more of it than an employe who is dissatisfied, fearful of the future, and who does his work in an unfavorable physical environment. For want of a better name, this division of the work is called "welfare work."

Industry is coming to regard personnel as one of the big factors to be considered in every undertaking, and if it is so, then the work of the welfare department is an economic necessity. But this work must be conducted along economic lines, as every other department is conducted, every dollar spent on it must yield 100 cents in return.

It is the duty of the welfare division to go after the fundamental things first. The question of wages and hours of labor are, of course, such broad subjects that all the administrative officials of the company collaborate on them. The welfare division, however, gives constant attention to matters of almost equal significance, the conditions under which the employes work—light, air, safety devices, sanitary arrangements. It is not reasonable to expect an employe to reach his or her place of work in the willingnes, if he has to pass through the garnut of dark, congested coat rooms and either climb several flights of stairs or wait his turn to get into an elevator together with a crowd of other workers, al as vexed as he. To bring the individual employe to the frame of mind where he is able to deliver efficient services, it is obvious that the employer, through the welfare division, should arrange for those physical surroundings which will breed self-respect, cheerfulness and confidence.

Restaurants are maintained, where the employes can secure their meals at minimum rates without going outside. Restaurants of this kind are largely self-supporting. Good food makes for good health, especially when served under agreeable conditions, and the lunch hour is the time when the employes meet socially.

In addition a recreation room where those who wish to talk and engage in more active persuits are permitted to make as much noise as they wish. It has been found that rest rooms, smoking rooms and recreation rooms justify their expense many times over bby keeping the employes in the building during the noon hour.

In General

By the very nature of its field, the employment department must be a service department. It is not an operating department, but it should work hand-in-glove with the genuinely sincere way to increase their own efficiency, through increasing the efficiency of their employes. It should not seek credit for what it does, only results—onwhich in the end is must stand or fall. Many of its achievements for the improvement of the working force must beb accomplished indirectly, by counsel and advice, and the credit oftentimes must go elsewhere. If by its activity, either direct or indirect, there results permanent economic advantage to the company through the improvement of its human relations, the employment department will take its

place in the organization as one of the productive departments.

The Plan of Promotion

An adequate system of promotion is the solution not only of holding employes in an organization, but also of the employment problem.

There is to-day much emphasis upon the proper selection of employees, and many and elaborate systems have been undertaken for a scientific placement. These are not in army wise to be criticized, for the selection of the indiviiduals comprising any organization is important, and any plan that will cause the employment manager to plan his duties carefully and to give each decision on the fortunes of others careful consideration is to be commended. It must beb realized, however, that even more important is holding and helping these employees after they have been selected, and providing an adequate systematized plan of advancement for them. It has been so figured in some plants that efficient placement becomes almost automatic, and a supply of desirable applicants for any position is constantly available. The following three points are important:

1. The necessity of attracting desirable applicants.
2. The necessity of holding, fitting and promoting those already employed.
3. The interdependence of these two.

This plan of promotion considers each employee as occupying three positions in the organization, and considers these three positions as constantly changing in an upward spiral, as the man is promoted from the lowest position that he occupies. The three positions are as follows: first, and lowest, the position that the man has last occupied in the organization; second, the position that the man is occupying at present in the organization; third, and highest, the position that the man will next ocupy. In the first position the worker ocupies the place of the teacher, this position being at the time occupied by two other men, that is, by the worker doing the work, who receives little or no instruction in the duties of that position except in an emergency, and by the worker below who is learning the work. In the second position the worker is actually in charge of the work, and is constantly also the teacher of the man next below him, who will next occupy the position. He is also, in emergencies, a learner of the duties of his present position from the man above him. In the third position the worker occupies the place of the learner, and is being constantly instructed by the man in the duties of the position immediately above.

Naturally a plan like this demands a close co-ordination of all positions. This is provided for through the master promotion chart. This chart is in the hands of the man in charge of promotion. It consists of a schematic arrangement of all positions in the organization, so arranged as to provide for lines of most rapid advancement, along the various functions and subfunctions, under which the measured functional management by which it works. The great advantage of such a chart is that it makes possible visualizing the complete problem of the organization's needs in teaching and preparing its members. The direct product of this is that the man in charge of promotion sees clearly the needs and the means of filling them, the demand and the supply. The important by-product is the gradual evolution of permanent, rapid, direct paths of promotion. Another by-product of this chart is the fact that the promotion head, the promotion manager, or chief of promotion, as he has been variously called, can arrange for shifting or transferring the worker easily, if he sees that he has been improperly placed, or, if he develops abilities along some unexpected line. This is often the case under this type of management where there is great opportunity for the development of talent, as well as apparent, abilities.

Upon the promotion charts the records of each and every member of the organization are separately kept. When a worker becomes a member of the organization he is called into the department in charge of advancement or promotion, and given one of these charts. Upon it is shown his present position, and he and the man in charge outline together his possible and probable line of advancement. The projected line of promotion is outlined in green, and upon it are placed the dates at which it is hoped he may reach the various stages of advancement. At set times the worker and the promotion chief, or one of his helpers, meet, and the line of actual progress of advancement of the worker is traced upon the map in red, with the dates achieving the various positions. The two then consult as to existing conditions, the special reading and studying necessary for fitting for the new positions, possible changes, or betterments.

The ultimate success of this plan depends upon the principles that underly it, giving every man a square deal, a maximum chance for cooperation, advancement and prosperity, in other words, the opportunity for simultaneous individual and social development.

ROMANCE OF GAS BY-PRODUCTS

By I. T. H.

There is nothing more remarkable in the fairy tales of industry than the manner in which the Cinderellas have been taken from the kitchen, so to speak, and given precedence over their step sisters. In soap-making, for instance, at one time the soap was the only thing that mattered and the glycerine which was produced at the same time from the fats and oils was run down the drain. Now the soap works are busy night and day primarily making glycerine for munitions, and the soap is almost a waste product. It has been very similar in gas making. At one time the gas liquor with its evil smell was merely a nuisance, now nearly all our ammonia for fertilizing the fields, a large part of our sulphur, and the cyanides for the extraction of gold are obtained from it. Not long ago the recovery of tar from the bottoms of pits and canals, where it had been run to get rid of, was quite a business, but tar now gives us the bases of our aniline colors, many of our most valuable medicines, and even perfume; while the tar oil becomes at the touch of the chemist's wand, lyddite, trinitro-toluol, and similar substances for the terrible high explosives for our shells, mines, and torpedoes. So valuable have the benzol and toluol become that the tar, however carefully it be treated, does not supply enough, and processes have been at work for some time to recover the comparatively small quantities that exist in coal gas itself. So far these methods have been only partially successful. According to a new process, it will be possible to secure about two gallons of benzol and a tenth of that quantity of toluol from every 1,000 cubic feet of gas. The method is simplicity itself. The gas passes through a tower filled with lumps of porous material saturated with oil, which absorbs the whole of the benzol and toluol, and then by the simple application of steam separates them; they float on the top of the condensed water, and can be drawn off ready for use, requiring only to be separated from one another by distillation. The discovery will add very greatly to our resources not only for making high explosives during the war, but also for our rapidly growing aniline dye industry in both war and peace; and later, when our big guns are at rest, it will provide a source of fuel for our motor vehicles.

The exportation of refrigerated beef is one of the important features of the Brazilian export trade during the past few years. From 1914, the first year of the war, the exports have increased from 1 ton to 66,452 tons in 1917. Brazil is unquestionably destined to become one of the great meat-producing countries of the world, and not only do its present exports bear out this fact, but the establishment of large packing plants, many of the mbeing financed by large American firms, shows clearly that the future prospects of the country as a producer of fresh meat are very promising. More than 50,000 tons, or nearly 80 per cent. of the total of refrigerated beef, went to Italy; Egypt took nearly 6,000 tons, France over 5,000 tons, and Great Britain nearly 4,000.

Gage glasses are very susceptible to surface abrasions, even so minute as to be unobservable. If one receives the slightest scratch inside or out, it should not be used, and in handling or keeping them in stock, no metal of any nature should be allowed to come in contact with them. They are particularly liable to break if iron or steel touches them and should never be laid even temporarily with tools, as is frequently done.

Making Shrapnel and High Explosive Shell Bars

Weight and Balance of a Shell Made From Solid Bar Steadier Than That of a Cast Shell in Flight Through the Air

By W. S. Standiford

IMMENSE quantities of shrapnel and high-explosive shells have been made in U.S. for the Allies and since the United States has joined in the conflict considerable amounts of munitions are required by the American Forces; as steel bars are the basis from which the shells are manufactured, the design of the rolls, their proper adjustment and handling should be subjects of much interest.

At first thought one might suggest that the shells be manufactured faster and better from castings containing the chamber for powder and bullets, thus leaving very little metal to remove in the machining processes, as contrasted to the existing practice of punching a hole in a solid steel blank and then finishing the interior and exterior. But castings cannot be used in this case for cast metal usually contains airholes, making it dangerous material for shells; were cast shells used, there would be danger of their bursting in the guns.

Another reason is, that the weight and balance of a shell made from a solid bar has a steadier flight through the air than one made from a casting, since in the latter, the heavier ingredients of the steel settle to the bottom during the cooling, making certain parts of the walls heavier than others, which obviously disturbs its balance during flight. Steel bars as munition material have the carbon and other ingredients equally distributed, for the rolling process mixes them equally, making the metal fibrous in character.

The size of the round bar is 3½ inches in diameter; this is the size used to make the 18 pound projectile used in British field guns, and it will be noted that sufficient metal is allowed on the above sized bar to permit of the machining operations. In the first illustration, are represented the roughing rolls, the latter being three-high; which design rapidly reduces the steel as compared with the two-high ones; quick reduction of the hot bars at the start is most important, for the metal must be worked while it is at a high heat, this makes it fibrous, which is a desirable quality, since this condition makes for strength in iron and steel; the roughing rolls contain two boxes and two edging passes; the others being put in on an angle.

FIG. 1—ILLUSTRATES BOX AND EDGING PASS ROUGHING ROLLS. THE DEEPEST PASS IN THE BOTTOM ROLL BEING WHERE THE STEEL BILLET IS ENTERED FROM THE FURNACE. THIS STYLE OF GROOVE REDUCES THE METAL VERY RAPIDLY, THE VIOLENT CHANGE IN SECTION FROM THE BOX AND EDGING PASSES TO THE SQUARE ONES THE STEEL FIBROUS IN NATURE WHICH IS A HIGHLY DESIRABLE QUALITY IN IRON AND STEEL.

Box and edging passes, by their shape, allow heavy drafts to be used, which is exerted upon the tops and bottoms of the bars, there being no work done on the sides. The heated metal from the furnace goes into the deepest box pass, it is then pushed into the next largest one between the middle and top rolls; being now turned over on its side, it goes through the edging pass in the bottom roll and is repeated through the top edging pass.

The steel in the shape of a long square bar is now ready to be rolled in the angle shaped passes which next engage our attention; these have an angle of 95 deg. and by their position in the rolls, work the bars mostly on the top and bottom corners—the corners at the sides have no work done on them. The bar goes through the angle passes alternately, until it is reduced to four inches in diameter; then it is ready for rolling in the hand rounds or finishing rolls which appear in the second illustration.

Any person looking at a set of hand round rolls in the housings or a drawing of them would wonder how they could make a round bar, as the grooves appear to have an oval shape instead of a circular one, but this is a case where appearances are deceptive; the grooves are put in by means of round steel plugs, which are ground after hardening, as the latter throws them out of true circular form.

Each roll contains one-half of the grooves for making various sized round bars; after the round groove is put in by means of the plug, the sides near the top are cut away at an angle by using another tool, the reason for this being that it prevents a long ridge or fin from forming on each side of the

FIG. 2—SHOWS THE APPEARANCE OF THE PASSES IN THE FINISHERS. THESE PASSES IN THE ROLLS APPEAR ANYTHING BUT ROUND, THE CUTAWAY PARTS OF EACH PASS BEING NECESSARY TO LET THE BAR LEAVE ROLLS EASILY WITHOUT TEARING IT AT THE JOINTS OF THE ROLLS. THE SHADED SECTION OF A BAR IN THE FINISHING PASS SHOWS HOW A BAR LOOKS IN THE OVAL-SHAPED PASS.

bar at the joint of the rolls. The following description of the rolling of a bar will show how it is made round instead of oval. The four inch square bar from the roughing rolls is sent once through the 3¾ inch pass, it is then turned over at a right angle to its previous position and is pushed into the 3½ inch finishing pass; as the bar from the 3¾ inch groove goes through the 3½ inch one, the metal spreads out in the extended sides and is about 7/16 of an inch wider at the sides as a result.

The part that touched the top and bottom of the pass being the correct size, it is then again turned over at a right angle so that the wide part will touch the top and bottom of the grooves, and rolled again; the part of the bar rolled to the finished size now faces the cut away portions of the pass, but does not touch it, therefore it keeps the right diameter while the wide part of the bar is being rolled to size. This is followed by again turning it to a right angle to its previous position and giving it its final rolling; the shaded outline of the finished bar indicates that the total width of the cut away clearance part of the pass is slight. In buying steel for shrapnel shells, the requirements of the purchaser are most exacting, with the result that the manufacture of shrapnel and high-explosive bars is costly.

As an example, bars for high-explosive shells call for a discard of 40 per cent. of the ingot; bars for shrapnel, 30 per cent., and ordinary steel bars about 15 per cent. The bars for high-explosives and shrapnel shells are subjected to a rigid inspection, the demand for a large ingot waste by the purchaser is due to the latter's desire to secure a metal free from airholes and segregation, which would interfere with the proper working of the shells in the guns.

THE PRODUCTION OF LIQUID AMMONIA

By Mark Meredith

Until the beginning of the war Holland was dependent for its supply of liquid ammonia upon England, Germany and more particularly Belgium. At the commencement of 1915 no liquid ammonia was to be had in Holland, as not only the ammonia itself, but also the steel cylinders for containing it, had been commandeered in the belligerent countries, or declared contrabrand of war. This caused much trouble to the industries making use of low temperatures. Calculation showed that the total annual consumption of Holland would amount to something like 27,000 kilogrammes.

At the Arnheim gasworks all the ammoniacal liquor produced was generally converted into pure concentrated ammonia solution: but during the war the high prices of sulphate, and the national need for artificial fertilisers, led to part of the ammonia being sent out as sulphate. The ammonia as driven off is saturated with water; but it is important now to obtain it as dry as possible, to ensure the safe working of refrigerating machines. The restrictions in this connection are therefore of increasing severity. Whereas some twenty years ago 0.9 to 1 per cent of water was permitted in liquified ammonia, the maximum now allowed has been lowered to 0.4 to 0.5 per cent. The drying properties of chloride of lime cannot be made use of, as it combines with ammonia. Caustic soda too is valuable in these days, so there remains only as an available drying agent burnt lime. This, however, has insufficient drying effect, except under pressure. With the pressure at normal, the lime generally left 0.9 to 1 per cent of water in the gas. The most effective means of producing totally anhydrous ammonia—with 0.05 per cent of water—is by evaporating the liquified ammonia, and subsequent reliquifying of this volatilised first product.

At the Arnheim works efforts have been made to eliminate the greater part of the water by cooling. To the current of wet ammonia gas, there is added liquified ammonia at a regular temperature. By the evaporation of the liquified gas the temperature falls as low as 15 deg. C. Thus the water is condensed, after which the gas is led through the drying apparatus. The condensed water is of course saturated with ammonia and leaves the compression plant through a syphon. The amount of liquid ammonia, about 7 per cent of the total bulk produced, is naturally not lost, as it is liquified again. It is taken from cylinders and not from the general storage holder, to permit of control of the quantity used. After this treatment the gas passes through two towers filled with lumps of burnt lime; the inlet being at the upper side, the outlet at the under side. Provision is made for subsequent treatment of the gas with caustic soda lumps in a separate tower.

After these processes the gas passes to a large storage holder, from which it goes to compressing plant very similar to that in use for the manufacture of ice, except that there is no brass and the compression cylinder stands in circulating cooling water. Mineral oil is used for lubrication, an oil-separator being placed after the compressor for removing the surplus oil. In spite of this cooling, the ammonia gas when compressed at from 7 to 10 atmospheres becomes warm. It is condensed in a large cooling coil, and then collected in a storage receiver of about 70 gallons capacity, thereafter being emptied from this into the steel bottles.

On the pressure side of the compressor, and above the cooling coil, there is a blow-off tap. The permanent gases, and more especially the air, which accompany the ammoniacal gas from the stills are blown off during the working, and conducted through water for the retention of the ammonia. From the storage receiver the ammonia is charged into steel bottles, after these have all been emptied by a small pump operated by the gas engine which drives the compressor.

The chemical and physical properties of gaseous and liquified ammonia are well known; but there is one peculiarity which may be referred to—the high expansion co-efficient of the liquid. At ordinary temperatures this expansion is less marked, but at slightly raised temperatures the increase becomes very marked gramms.

At 10.0° C.	pressure is	88.2 lb.	per sq. in.
" 50.0° C.	"	"	294.0 lb.	"
" 65.7° C.	"	"	455.7 lb.	"
" 67.7° C.	"	"	860.0 lb.	"

Thus, for a rise of temperature of only 2 degrees C., the pressure is almost doubled. The filling of the bottles therefore needs special care, for when the expansion is not taken into account an explosion of the bottle is to be feared. The delivery of high ammonia during the first year amounted to 40,000 kilogrammes.

EASTERN SPRUCE FOR AEROPLANES

So great is the demand for airplane spruce by the Allies that eastern as well as Sitka spruce is now being used. Canada has large resources of eastern spruce, which has hitherto been used mostly for the manufacture of pulp, paper and lumber, and the British War Mission is at present trying to secure in eastern Canada as large an amount as possible of the grades suitable for airplane manufacture.

Eastern spruce has for some time been used for airplane construction in the United States, although only a very small percentage of this timber is sufficiently clear for this purpose. Tests made by the United States and Canadian governments show that where material of suitable quality can be found, this species serves admirably for airplane construction and may be expected to supplement the supplies of Sitka spruce from the Pacific Coast, which are only now beginning to approach adequate proportions.

The timber for use in airplanes has to be sawed parallel to the bark, instead of parallel to the axis of the log, as is done for lumber. In this way, straight-grained boards are obtained, having the highest possible percentage of material free from knots and possessing a maximum of strength.

ESTHETIC

Two fair munition workers were discussing their personal affairs.

"Got a chap yet, Liz?" enquired one.

"Yes; and he's a regular toff. He's manager at —"

"You don't say so! Why, they tell me he's real refined."

"Rather! Why, he took me to a restaurant last week, and when we had coffee he poured it into a saucer to cool it, but he didn't blow it like common people would—he fanned it with his hat."

The Duty of the Employer in the Reconstruction of the Crippled Soldier

In the Past the Pension System Proved a Failure Constructively — The Only Compensation For Physical Disability is Rehabilitation For Self-support

By Douglas C. McMurtrie,

Director Red Cross Institute for Crippled and Disabled Men, New York City.

SOON after the outbreak of hostilities the European countries began the establishment of vocational training schools for the rehabilitation of disabled soldiers. They had both the humanitarian aim of restoring crippled men to the greatest possible degree and the economic aim of sparing the community the burden of unproductivity on the part of thousands of its best citizens. The movement had its inception with Mayor Edouard Herriot of the city of Lyons, France, who found it difficult to reconcile the desperate need for labor in the factories and munition works while men who had lost an arm or a leg but were otherwise strong and well were idling their time in the public squares. He therefore induced the municipal council to open an industrial school for war cripples which has proved the example and inspiration for hundreds of similar schools since founded throughout France, Italy, Germany, Great Britain and Canada.

The disability of some crippled soldiers is no bar to returning to their former trade, but the injuries of many disqualify them from pursuing again their past occupation. The schools of training prepare these men for some work in which their physical handicap will not materially interfere with theid production.

Influence of Previous Training

The education of the adult is made up largely of his working experience. The groundwork of training in his past occupation must, under no circumstances be abandoned. The new trade must be related to the former or be, perhaps, an extension or specialization of it. For example, a man who had done manual work in the building trades may be instruction in architectural drafting and the interpretation of plans be fitted for a foreman's job, in which the lack of an arm would not prove a serious handicap. A trainman who had lost a leg might wisely be prepared as a telegrapher, so that he could go back to railroad work, with the practice of which he is already familiar.

Whatever training is given must be thorough, for an adult canot be sent out to employment on the same basis as a boy apprentice. He must be adequately prepared for the work he is to undertake.

The one-armed soldier is equipped with working appliances which have supplanted the old familiar artificial limb. The new appliances are designed with a practical aim only in view; they vary according to the trade in which the individual is to engage. For example, the appliance for a machinist would be quite different from that with which a wood turner would be provided. Some appliances have attached to the stump a chuck in which various tools or hooks can interchangeably be held. The wearer uses these devices only while at work; for evenings and holidays he is provided with a "dress arm" which is made in imitation of the lost member.

LEARNING THE OPERATION OF A DRILL PRESS.

Avoid Temporary Dependence

An important factor in the success of re-educational work is an early start, so that the disabled man shall have no chance to go out unemployed into the community. In even a short period of exposure to the sentimental sympathy of family and friends his "will to work" is so broken down that it becomes difficult again to restore him to a stand of independence and ambition. For this reason therefore, the plan for his future is made at as early a date as his physical condition admits, and training is actually under way before the patient is out of the hospital.

In the readjustment of the crippled soldier to civilian life, his placement in employment is a matter of the greatest moment. In this field the employer has a very definite responsibility.

But the employer's duty is not entirely obvious. It is, on the contrary, almost diametrically opposite to what one might superficially infer it to be. The duty is not to "take care of" from patriotic motives a given number of disabled men, finding for them any odd jobs which are available, and putting the ex-soldiers in them without much regard to whether they can earn the wages paid or not.

Yet this method is all too common. A local committee of employers will deliberate about as follows: "Here are a dozen crippled soldiers for whom we must find jobs. Jones, you have a large factory; you should be able to take care of six of them. Brown, can you not find places for four of them in your warehouse? And Smith, you ought to place at least a couple in your store."

Such a procedure cannot have other than pernicious results. In the first years of war the spirit of patriotism runs high, but experience has shown that men placed on this basis alone find themselves out of a job after the war has been over several years, or in fact, after it has been in progress for a considerable period of time.

Charity Jobs Deteriorating

A second weakness in this method is that a man who is patronized by giving him a charity job comes to expect as a right such semi-gratuitous support. Such a situation breaks down rather than builds up character, and makes the man progressively a weaker rather than a stronger member of the community. We must not do our returned men such injury.

The third difficulty is that such a system does not take into account the man's future. Casual placement means employment either in a makeshift job as watchman or elevator operator such as we should certainly not offer our disabled

COACH BUILDING IN THE RAILROAD SHOPS.

men except as a last resort—or in a job beyond the man, one in which, on the cold-blooded considerations of product and wages, he cannot hold his own. Jobs of the first type have for the worker a future of monotony and discouragement. Jobs of the second type are frequently disastrous, for in them a man, instead of becoming steadily more competent and building up confidence in himself, stands still as regards improvement and loses confidence every day. When he is dropped or goes to some other employment, the job will have had for him no permanent benefit.

Twelve men sent to twelve jobs may all be seriously misplaced, while the same twelve placed with thought and wisdom and differently assigned to the same twelve jobs may be ideally located. If normal workers require expert and careful placement, crippled candidates for employment require it even more.

Employer's Duty

The positive aspect of the employer's duty is to find for the disabled man a constructive job which he can hold on the basis of competency alone. In such a job he can be self-respecting, be happy, and look forward to a future. This is the definite patriotic duty. It is not so easy of execution as telling a superintendent to take care of four men, but there is infinitely more satisfaction to the employer in the results, and infinitely greater advantage to the employee. And it is entirely practical, even in dealing with seriously disabled men.

A cripple is only debarred by his disability from performing certain operations. In the operations which he can perform, the disabled man will be just as efficient as his non-handicapped colleague, or more so. In the multiplicity or modern industrial processes it is quite possible to find jobs not requiring the operations from which any given type of cripples are debarred. For such jobs as they can fill the cripple should be given preference.

Thousands of cripples are now holding important jobs in the industrial world. But they are men of exceptional character and initiative and have, in general, made their way in spite of employers rather than because of them. Too many employers are ready to give the cripple alms, but not willing to expend the thought necessary to place him in a suitable job. This attitude has helped to make many cripples dependent. With our new responsibilities to the men disabled in fighting for us, the point of view must certainly be changed. What some cripples have done, other cripples can do—if only given an even chance.

The industrial cripple should be considered as well as the military cripple. for in these days of national demand for the greatest possible output there should not be left idle any men who can be made into productive workers.

With thoughtful placement effort, many men can be employed directly on the basis of their past experience. With the disabled soldiers who profit by the training facilities the Government will provide, the task should be even easier.

A Patriotic Duty

This, then, constitutes the charge of patriotic duty upon the employer:

To study the jobs under his jurisdiction to determine what ones might be satisfactorily held by cripples. To give the cripples preference for these jobs. To consider thoughtfully the applications of disabled men for employment, bearing in mind the importance of utilizing to as great an extent as possible labor which would otherwise be unproductive. To do the returned soldier the honor of offering him real employment, rather than proffering him the ignominy of a charity job.

If the employer will do this, it will be a great factor in making the complete elimination of the dependent cripple a real and inspiring possibility.

Maintaining a constant water level irrespective of the rate of evaporation affords considerable protection to the boiler, inasmuch as the danger of low water is removed, and the danger of injuring the engine or other steam-using machine, due to slugs of water being carried over from the boiler is entirely eliminated.

A POINT deserving of attention from brass founders is the marking of runners with a certain mark for each class and mixture of metal. In some cases the molder can put a certain mark with his tools, but if a stamp be used to denote each particular mixture, the men who chip off the runners can easily distinguish what class of metal it is made from, and the scrap gates can be kept quite separate.

RECEIVING INSTRUCTION IN THE MACHINISTS' TRADE.

Good Progress Made at Dominion's New Plant

Actual Building Operations Were Under Way Before the Shops Were Completed—Excellent Progress Has Been Made on the Work

GOOD progress is being made in the construction of the new plant for the Dominion Shipbuilding Co. at the foot of Bathurst street, Toronto, and actual shipbuilding operations are under way although the shops are not completed.

The main building is 485 feet by 210 feet divided into two sections, the first section comprising the plate shop and the second section the joiners shop with mould loft above. The power plant is also included in the main building while the furnaces are in an annex adjoining the eastern end of the plate shop.

The building is of steel construction with steel roof trusses while the outside walls are fireproof, being made of steel mesh treaded with "Gunite." All partitions walls are of hollow tile construction. The windows have Finestra steel sash. The roof of the plate shop is corrugated iron while the roof over the mould loft is made up of boarding covered with built-up roofing material. The steel work was supplied and erected by the Dominion Bridge Co.

The furnaces for heating angles and ship shapes etc., which are oil fired, were designed by John Main and installed by the Canadian Incinerator Co., Toronto. A considerable section of the floor in one bay of the main building is laid out for working up angles and other shapes. The other four bays of the plate shop each have a "Northern" electrically operated, overhead, travelling, 3 ton crane, while the equipment consists generally of punching and shearing machinery, etc., for fabricating plates, etc., for the ships under construction. All the machines are motor driven. Some delay has been experienced in obtaining the woodworking machinery, otherwise the joiners, shop would now be in operation.

The foundations have been laid and steel work has been erected for another building which will be 325 feet by 155 feet and will take in the machine, blacksmith, pipe and electrical shops. The construction of the second building will be similar to the first. In order to carry on the construction of the ships, while the new shops are being erected temporary woodworking and blacksmith shops and stores, etc., are being used. It is expected that the new plant will be completed and in operation this Fall. The site of the plant covers about 16 acres and is practically all made land. The concrete retaining walls were constructed and the site made by the Toronto Harbor Commission, being part of the scheme for developing the harbor front.

At the present time one hull is being plated and keels laid for two other huls. The company expects to deliver three ships this season including one, the "Troja," which left in June for Montreal in ballast. Over the shipbuilding berths are the electrically operated gantries having a span of 68 feet. Both these gantries are complete except for the motors which have not been installed yet. There are five berths altogether, so the company will be able to build that number of ships at a time when the plant is finished. The Dominion Shipbuilding Co. will have a plant up-to-date in every feature and a valuable acquisition to the shipbuilding industry in Canada. Construction work on the plant was started in December, 1917, and considering the severe weather in the winter and difficulty of obtaining steel excellent progress has been made with the work.

VIEWS TAKEN AT THE PLANT OF THE DOMINION SHIPBUILDING CO.

The Types and Industrial Uses of Pyrometers

The necessity for accurate temperature control of industrial processes has led to the development of the various types of pyrometers in present day use, from the delicate laboratory appliance to that of an industrial manufacturing appliance. The following article reproduced through the courtesy of Alfred Herbert, Ltd., illustrates some of the types and their uses.

THERE is no need, at the present time, to insist upon the necessity for pyrometers in connection with heating processes, because that necessity is well recognized.

Contrasting the position to-day with that which existed say fifteen years ago, we find that the pyrometer has advanced from the limited position of a delicate laboratory instrument to that of an industrial manufacturing appliance. When the pyrometer was only to be used in the laboratory, in the hands of specially trained experts, the problem, from the point of view of the instrument maker, was relatively simple, although the instrument maker did not so consider it in these days. The laboratory pyrometer made occasional excursions into the works, usually with disastrous results, at any rate, to the pyrometer.

However, it became obvious that the information, with regard to the influence of accurate temperature regulation upon the resulting product could not be of any industrial value unless pyrometers could be applied to the industrial heating processes involved, therefore it was necessary to design pyrometers which could be used safely in the works.

The time has now come when the user of pyrometers under industrial conditions should know more about the principles upon which those instruments operate, the various factors which enter into the design and successful application of any type of pyrometer to industrial heating processes.

Pyrometer Classification

Pyrometers may be divided into two broad classes as follows:

"A." "Contact" or inserted pyrometers, in which some portion of the apparatus is actually subjected to the temperature to be measured such as:

1. Expansion instruments, the mercury-in-glass thermometer, and various other types in which differential expansion of some kind, either liquid or solid, is the means of measurement.

2.—The electric resistance thermometer, depending for its action upon the change in resistance by a coil of wire when its temperature changes.

3.—The thermo-electric or thermo-couple pyrometer, depending for its action upon the electro-motive force or voltage developed at the junction between two dissimilar metals or alloys when that junction is heated to a temperature different from the remainder of the electric circuit.

4.—Melting-point pyrometers, in which the melting of some alloy or mixture of salts or clay indicates the passage above a certain fixed temperature, these may be termed "fixed point pyrometers."

"B." "Distant" pyrometers, in which no part of the instrument is subjected to the actual temperature to be measured, but which operates entirely at a distance from the hot body under measurement, comprising:—

FIG. 1.

5.—The optical pyrometer, in which the measurement of temperature is made by matching the brightness or color of the hot body against that of a standard in the instrument and computing the temperature by the adjustment which has to be made in the instrument.

6.—The "total radiation" pyrometer, which measures the temperature of the hot body by means of the radiated energy therefrom, both luminous and non-luminous.

Variation In Indications

It must be remembered that a pyrometer in which the sensitive portion is subjected to the temperature measures actually the temperature of its sensitive portion. It is clear that the temperature of the "hot junction" may be different from the material in the furnace, bath or other apparatus, due to the conditions briefly mentioned below.

(a) Thermal conduction of the pyrometer sheath. It is usual, and generally necessary, to employ an outer sheath to protect the actual thermo-couple from the action of the furnace gases or the material in a bath. Heat is transmitted from the furnace gases or bath through the sheath to the thermo couple "hot junction," and if this sheath is of large cross section some of this heat will be conducted away along the length of the sheath and will not reach the thermo-couple. This lost heat may result in the thermo-couple junction being at a lower temperature than the furnace or bath if sufficient depth of insertion is not provided.

(b) Temperature inequality in the furnace or bath. In direct fired furnaces, particularly when the door or other opening is large in relation to the furnace and is opened frequently, large differences may exist between different parts of the furnace.

(c) Unless the material which is under treatment is left in the furnace or bath a sufficient time it will not attain the temperature of the furnace, and therefore may be at a much lower temperature than that measured by the inserted pprometer.

These conditions and limitations apply with equal force to other types of pyrometer than the thermo-couple—in fact, in the case of the electric resistance or expansion instruments the larger bulk of the sensitive portion may aggravate the resulting errors.

Suitability of Contact Pyrometers

From the foregoing considerations it will be clear that the "contact" or inserted pyrometer is suitable for those cases in which the material under treatment remains in a closed furnace or in a bath for a time sufficient to ensure reasonable equality of temperature, and to cases in

FIG. 2.

FIG. 3.

which the furnace temperature, as measured by the pyrometer, is kept at a steady figure and the material, of uniform heat capacity, is fed into and out of the furnace at a uniform rate.

Distant Pyrometers

Turning to the "distant" pyrometers, optical or total radiation, the measurement being made by the radiated light or heat, the pyrometer, if correctly used, will measure the temperature of the surface presented to it. That surface may be the inner wall of a furnace or the material in a furnace. The use of a radiation or optical pyrometer is subject to the following limitations:

(d) Unless the pyrometer is specially calibrated for other conditions, the hot body under measurement must be within a deep enclosure which is fairly uniformly heated. If these conditions do not obtain the measurement will be dependent upon the reflecting power of the surface of the hot body. It is, however, possible to calibrate these pyrometers for given surfaces out in the open or to apply a factor to the observed reading.

(e) The heat or light radiated from the hot body to the pyrometer must not be intercepted by smoke or gases containing solid particles. In the case of the optical instrument luminous flames, even though not containing solid particles, may, nevertheless, affect the reading very largely. The "total radiation" instrument is very little affected by clear flames, hence this latter type is frequently preferable for use by relatively unskilled observers.

The remarks under (d) and (e) show that the "distant" pyrometer is particularly suitable for work of an exploring nature and for the measurement of temperature of individual pieces of material or particular parts of a furnace. It is also, of course, preferable where the temperatures to be measured are very high and where consequently the life of the thermo-couple sheath and sensitive tip would be short.

The "total radiation" instrument has the advantage of being practically automatic in action, so that it can be used as a simple indicating or as a recording instrument, it does not require manipulation or adjustment by the user. It has the disadvantage of requiring a relatively large hot body surface for measurement, though this disadvantage is more apparent in the laboratory than in works practice.

The optical pyrometer can not be made directly indicating or recording, it depends upon the adjustment by the user to make a measurement. It is, however, useful when the hot body under measurement is small.

Turning again to the thermo-couple pyrometer, experience shows that the detail arrangement and application of the instrument to the furnace or bath have a very large influence upon its success.

Pyrometer Location

If the pyrometer is inserted through the crown of the furnace, as shown at Station 4 in Fig. 1, and projects deeply into the furnace space, it is frequently found to be in the way of the work in the furnace. If the same position is retained and the depth in the furnace reduced, one or two troubles may be met. If the furnace is uniformly heated the pyrometer may read low due to insufficient depth of insertion. If, alternatively, the furnace is heated largely by radiation from the furnace crown and flames at a higher temperature are passing along under the furnace crown to maintain its temperature, then the pyrometer will have its hot junction directly in the path of these flames, and will tend to measure their temperature rather than that of the material in the furnace. Added to this trouble is the fact that the life of the pyrometer sheath would be short under these circumstances.

Occasionally insertion through the side of the furnace is preferable in the manner shown at Station 7, Fig. 2, though the same class of difficulty may arise here. A preferable method of insertion is shown at Station 9, in Fig. 2. In this arrangement a pocket or channel is cut in the side of the furnace and the pyrometer sheath installed therein. In this way the flames in the furnace will not impinge directly upon the sheath, the sheath being heated largely by radiation from the furnace walls and from the material in the furnace.

In a large number of furnaces the arrangement is such that the pyrometer sheath has to cross an outer fire or flue space before reaching the working space of the furnace, and here again special consideration must be given to the details of installation. The gases in this fire space may be at a temperature very different from that in the working space of the furnace, and this temperature will influence the reading of the pyrometer unless particular care is taken to keep that temperature away from the sensitive tip of the pyrometer. Two different methods of installation are shown at Stations 10 and 12, in Fig. 2, to meet such cases.

When considering the application of the pyrometer to a bath of molten salt or metal, the sheath is extremely important, but it is not at all easy to secure a satisfactory sheath where the temperature is high. The bath, however, has the great advantage of giving good heat conduction from the bath to the sheath and approximate equality of temperature in various parts of the bath. Typical methods of installation are shown at Station 5, Fig. 1, and Station 8, Fig. 2.

In the foundry work on low melting alloys, non-ferrous alloys and aluminium constitutes a field in which the use of the thermo-couple pyrometer is being rapidly extended. Previous to the adoption of the Hoskins' alloys nickel-nickel chromium, there was no practicable thermo-couple which could be inserted unprotected by a sheath in these metals, the alloying effect was so great that the thermo-couple was destroyed after a very few readings.

The use of a sheath, as indicated at Station 11, in Fig. 2, is legitimate only where the time lag due to the heat capacity of the sheath is not an objection. Usually in foundry work the time lag of the sheath is an objection, and fortunately in such cases the Hoskins' alloy thermo-couple provides a solution of the problem.

It is made with fairly thick wires, and the tip of the thermo-couple is inserted directly into the molten metal, but removed as soon as a steady reading is attained. The thermo-couple wires are alloyed away by the molten metal at a rate varying with the nature of the alloy being melted, but with non-ferrous alloys and aluminium this rate is sufficiently slow to enable a large number of readings to be made before a thermo-couple renewal is necessary. When that renewal is necessary its cost is not very large, therefore the method is commercially justifiable.

After the fused junction between the two alloys has been destroyed by the molten metal the metal itself forms a junction so that this use of the pyrometer can be continued without making a new junction.

Details of Electric Circuits

Time and money spent upon the details of the electric circuit of a thermo-couple pyrometer are a good investment. It is a mistake to wire up a pyrometer with "bell wire." It has been found that heavy cable well protected—as, for instance, by screwed conduit, as shown at Station 12, Fig. 2—is well worth the time and trouble taken in the first installation. Similarly switch connections should be large, simple and easily adjusted. It should be remembered that the voltages available in pyrometer circuits are extremely low, frequently only small fractions of a volt and that circuit accessories which are quite suitable for lighting or power circuits will not give reliable results in a pyrometer circuit, the voltage is not enough to break down a film of oxide or other surface corrosion.

The indicating or recording instruments to be used with the thermo-couple should be sufficiently robust to withstand the unavoidable rough usage frequently met with in industrial work. Delicate suspensions are quite out of place in the works. Notwithstanding the maximum robustness attainable, it is advisable to choose favorable positions for instruments which are permanently installed.

Radiation Pyrometers

In the case of the "total radiation" pyrometer protecting sheaths are not required, and therefore the application of these instruments is in many cases much simpler. In view of the valuable exploring service which can be obtained from a radiation pyrometer, that instrument is most frequently made in a portable form, though there are many cases also where it is permanently installed as a recording instrument.

When considering a hot body inside a furnace or other approximately uniformly heated enclosure, the temperature measured is that of the surface presented to the instrument. For instance, at Station 1, Fig. 3, the surface being measured is the back wall of the furnace.

At Station 2 the peep hole has been coned out to allow of measurement of the temperature of the hot bodies lying on the floor of the furnace. This figure also indicates a method whereby a number of hot bodies being treated together may be made to provide a large enough surface for the pyrometer, although individually the hot bodies are small.

In Station 3 the door is shown raised to measure the temperature of the hot body "c."

As previously mentioned, the radiation pyrometer requires a relatively large hot body, but where a single small hot body is under treatment it is possible to measure its temperature if it is allowed to rest upon the floor of the furnace or against the wall of a furnace and to heat up until, by the eye, it has the same brightness as the surface against which it rests. Station 4 in Fig. 3 illustrates this method of use.

In using a radiation pyrometer it is, of course, necessary to prevent flames from the furnace reaching the pyrometer; it is equally necessary to prevent furnace gases from entering the pyrometer receiving tube, although these gases may not be visible as flames. There is usually little chance of this happening, but where the danger does exist it may be guarded against by arranging a cross blast of air to blow away any flames or products of combustion which might otherwise enter the receiving tube of the pyrometer. Such an arrangement is shown at Station 4, Fig. 3.

In the foundry the radiation pyrometer is useful for exploring the temperature of a pot furnace. In order that the temperature as measured may be independent of the nature of the surface under measurement the lid of the furnace is only partially removed, as shown at Station 6, Fig. 3.

Station 7 shows a method whereby the radiation pyrometer is used upon an adjustable bracket for permanent work as, for instance, a recording instrument.

As mentioned previously, the radiation pyrometer may be used, by means of a special calibration, upon hot body surfaces which are out in the open and not in uniformly heated enclosures. In such cases the reflecting power of the hot body must be taken account of.

Any surface which has reflecting power will radiate less energy than a non-reflecting body; it is not what is known technically as a "black body," that is, it is not a body which would appear dead black if it were cool.

Fortunately the oxidised surfaces of iron, steel, copper, whether molten or solid, radiate with an efficiency which is approximately a uniform percentage below that of the "black body," therefore the radiation pyrometer may be calibrated for use under such circumstances with sufficient accuracy for industrial purposes.

For instance, the temperature of a forging under the hammer may be measured, without interrupting the process, in a manner indicated diagrammatically at Station 8, Fig. 3. Of course, in such cases, it is necessary to remove dross or any non-adherent scale before a measurement is made.

When Le Chatelier first developed his thermo-couple pyrometer he employed thermo-couple wires of pure platinum against platinum alloyed with 10 per cent. of rhodium. He chose these wires because they were of high melting point and were relatively unalterable.

It has subsequently been found, however, that these wires are influenced seriously by reducing gases and the metal vapors which may exist in those gases. The wires become crystallized and also suffer a fall in E.M.F., and therefore a change of calibration, frequently of large amount, before the wires fractured.

Owing to the high expense of platinum in these alloys the wires are necessarily very thin and therefore liable to rapid attack, while the user is tempted to continue their use as long as possible owing to the very high cost of replacement.

Having chosen the alloys, the problem was then to devise a galvanometer suitable for use as an indicating instrument. The alloys, being expensive, were used in the form of very thin wires, about a fiftieth of an inch diameter; they were therefore of high electrical resistance and subject to a large increase in resistance when heated up in the furnace. In order to mask the change in calibration which would follow this increase in resistance, an indicating instrument was used which had a very high internal resistance so that the change in resistance in the circuit was relatively small. Since the copper wire in the coil of this indicating instrument was itself subject to an increase in resistance when the instrument became hot, a further "ballast" resistance had to be added in the form of a wire whose resistance did not increase when heated up. The net result of this high internal resistance was an instrument having very weak moving forces, because the electro-motive force or voltage of the platinum-platinum rhodium thermo-couple was in itself very small.

The discovery that "base metals"—that is, cheaper alloys—could be used as reliable thermo-couple opened up a new field in pyrometry, and it has been found that for all except very high temperatures the base metal thermo-couple forms a reliable industrial pyrometer. The Hoskins' alloys, nickel-nickel-chromium or nickel chromium-nickel copper have the advantage that they are much cheaper than the platinum alloys, and therefore may be used in the form of thick wires, and the further advantage of a much larger electro-motive force. As the wires are thick they are of low resistance, and fortunately also they have very small increase in resistance when they are heated up in the furnace. Therefore the necessity of having an indicating instrument of high internal resistance is no longer usually prominent. If the whole circuit resistance is low the current flowing in the circuit will be proportionately larger, and the net result is that the moving forces in a low resistance "base metal" pyrometer using the Hoskins' alloys are of the order of fifty times as great as those of the high resistance platinum alloy pyrometer. The gain in robustness and suitability for industrial work will be obvious.

It has been pointed out already that a sheath is necessary to protect the thermo-couple, as far as possible, from the influence of contaminating vapors. In the case of the platinum alloy thermo-couple this sheath must be literally impervious to gases. Unfortunately, the only materials which can approach this condition of imperviousness are, in themselves, fragile—for instance, silica (quartz) or glazed porcelain. In industrial work it is the sheath which sets the practical limit to the temperature at which a platinum alloy thermo-couple may be used, and this maximum temperature is unfortunately many hundreds of degrees below the melting point of the thermo-couple wires, therefore the fact that the melting point is very high is really of no practical value.

Admittedly, the base metal alloys have much lower melting points, but since the question of the sheath sets the limit still lower than the melting point, this fact is of small practical interest under industrial circumstances. To formulate an approximate general rule it may be said that above 1,000° C. for continuous work or 1,300° C. for intermittent work, no thermo-couple could be used under industrial conditions usually obtaining. For this reason the preference for the radiation pyrometer becomes greater as the temperature increases.

Of course the adoption of the low resistance circuit is quite out of the question with a platinum alloy thermo-couple, but the low resistance circuit cannot be advanced as an entire disadvantage to the base metal thermo-couple because the conditions of mechanical robustness would usually make advisable a fairly heavy gauge of copper connecting wire, and in any case the cost of the copper connections is relatively a small fraction of the total installation cost. In the choice of a sheath for a base metal thermo-couple the field is very much wider; metal sheaths may be used with consequent increase in mechanical robustness and reduction in cost. The Hoskins' nickel chromium alloys cast in the form of a sheath give particularly good service under severe conditions up to about 950° C. Of course, such a sheath cannot be used with a platinum alloy thermo-couple because the metal vapors emanating from the sheath itself would contaminate the thermo-couple.

To be continued

THE IRON SITUATION IN JAPAN

On account of the iron and steel situation in the United States, where, because of successive orders placed by the government for military requirements, and the increasing private demands that have developed in that country the demand has greatly exceeded the supply, the manufacture and delivery of steel for exportation to Japan cannot be undertaken unless the government's orders are first completely filled. Because of these government restrictions, even the orders already contracted for, to say nothing of new orders, cannot be shipped abroad without the government's consent, so naturally delay is inevitable. The question of how long this situation may last cannot be easily fathomed. At any rate, for the present the import of American iron into Japan cannot be proceeded with satisfactorily.

In anticipation of higher quotations that may result, exporters and manufacturers in the United States are induced to make conditional contracts for Japanese orders consequent upon the difficulty in obtaining licenses to ship. On the other hand, Japanese merchants are holding over their orders fearing any future turn of events. This naturally results in the gradual decrease of imports, and it is impossible to know what change may occur in the market so long as imports of iron and steel cannot be carried on satisfactorily.

The price of iron has run up over 20 per cent. during the last month, while plate iron has also advanced, due to shortage of stocks. The ordinary inch goods rule at yen 45-46 per 100 kin, and the two-fifth inch goods in the neighborhood of yen 46-47 per 100 kin.

In the early part of May two-fifth inch goods were somewhere in the neighborhood of yen 1,100 per ton, but now the price of yen 1,200 is reached. Rod iron has had a sharp rise within the last few days, and at the same time the market for such has been very busy. Round iron, on account of its cheaper quotations, advanced also, the ordinary inch goods being quoted at yen 14, and the square goods at yen 15-19 per 100 kin. Nails and other minor goods have considerably stiffened, 3-5-inch to 1 1-5-inch goods bringing yen 32 per 100 kin.

Galvanized plate iron rules higher by yen 3-40 to yen 3-50, while galvanized wire has advanced about 5 per cent. All of these have advanced by 20 to 30 per cent. since last week. It is thought that another strong tone may prevail with the difficulty in importing American iron goods.

UTILIZATION OF WESTERN LIGNITE

A plan for the utilization of Western lignite that is likely to have far-reaching results has been formulated by the Council for Scientific and Industrial Research, of which Dr. A. B. Macallum is chairman.

The provinces of Manitoba and Saskatchewan import annually from Pennsylvania about a half million tons of anthracite for domestic fuel, and send out of the country, therefore, more than $4,000,000. There are in these provinces it is estimated, about fifty-seven million tons of lignite of a poor grade, and consequently, disqualified from serving as domestic fuel. It has been demonstrated, however, that they can be carbonized and briquetted, and that the product thus created is an equivalent of anthracite.

As a result of these investigations, conducted by the lignite committee, of which R. A. Ross, of Montreal, is the chairman, the council recommend that the government establish a plant in southern Saskatchewan to turn out 30,000 tons of this fuel yearly, the estimated cost of which would not probably exceed $7 per ton at the plant. The three governments concerned are about to sign the proposed agreement, the Dominion Government having already involved its share of the total cost of the plant. The governments expect to appoint the commission to operate the plant at an early date.

CONTINUOUS SHELL, HEAT TREATING FURNACE FOR 75 AND 155 M.M. WORK

A CONTINUOUS furnace for heat-treating 75 mm. and 155 mm. shells is being manufactured by the Strong, Carlisle & Hammond Co., Cleveland, Ohio. This furnace, which can be used for both hardening and drawing operations, is of the underfired type, constructed with a working tile floor 27 in. wide by 20 ft. long. In operation the flame from the gas or oil burners enters a combustion chamber beneath the working tile floor, and the products of combustion escape through ports in the arch. The furnace shown in the accompanying illustration is oil-fired from burners at the side and is being used for treating 75 mm. shells. In heat-treating 75 mm. shells, four rows of shells are passing through the oven at a time, and each row is supported by two 1½ in. steel bars. The nose of one shell pushes against the base of the shell just in front of it. At the charging end of the furnace is a table supporting the shells and also two cross-heads that move horizontally. Each cross-head pushes two rows of shells through the oven. The cross-heads are moved back and forth by means of two cranks that are rotated by means of a worm gear and worm. The balance of the drive consists of a pinion, gear and two cone pulleys. The cone pulleys are used so that the speed can be slightly varied. In heat-treating larger shells up to 155 mm. the charging end of the furnace is equippel with a hydraulic ram in place of the crank arrangement described above. The manufacturers can supply a master clock and bells so that the bells will ring at certain intervals and notify the operator that the hydraulic ram is to be operated. When fitted with this arrangement the furnaces for the larger shells are not automatic like the furnace for heating the 75 mm. shells.

The furnaces are shipped from the factory completely set up and crated. Upon arrival at the customer's plant it is only necessary to remove the skids and make one air and one oil connection for the burners.

The hood over the charging end as shown in the illustration was installed to carry away the heat which helps to keep the room cool. The pullies and belt shown at the left hand of the illustration drive the crank feeding arrangement. The quenching tank is shown at the far end of the furnace.

CONTINUOUS FURNACE FOR HEAT TREATING 75-MM. SHELLS.

BECOMING AN ENGINEER

By Batiste Lefore

My name is Batiste Lefore, I am ze french mans, I have been having ze troubles wis ze steam plant las week.

I was ze sweep de floor man in ze factory but every time de engineer clean out dose boilers he ask for Batistee to help hem. Well dat engineer he go to fight de hun and me Batistee being old fellow, I stay home. De boss say Batistee, how you like to be engineer and mak tree dollar a day. I say, sure for dat is fine job, all dere is to do is shovel in coal to keep dat steam up, oil up de engine and shafting, lace de belts, sharpen de knives, wash de windows, and sit down when nobody can find anyting for me to do. Sure, I make a grab for such a snap and de next morning I am on de job at 5 a.m. I fill up the fire hole wid coal and at 7 a.m. de whistle I blow for start work, de big valve called safety she be blowing at de same time.

After awhile de Boss come in and say, damn it Batistee why you let dat safety valve below. I say I tink she do dat for safety. He look at de glass and say where is de water, I tell him it is in de boiler I nevaire take eet out. He yelled pull out your fire or she will blow up, den he runs away and I runs after him. Well pretty soon de fire goes out and we get the boiler men to fix her up again and de boss show me how to put in de water and say do not let the safety valve plow so much. I am getting on fine and one day when I am painting de walls a feller comes in and says are you de engineer, I tell him I am him. He say I am inspector Dan Sharpise. Where is your certificate? I say, what is dat. He say a licence. I tell him I am not a dog and do not need a tag. He say you go to dose examiners and get a licence or I put you in ze coop. I say sacre, I not go in any hen coop. I go to see dese examiner fellow. He say Batiste vos you an engineer? I say sure. He say describe de engine you run. I tell him dere is a pipe to take de steam in and anoder one to take it out and a rod runs out and in and turns de wheels around. McGee he say. Ha name de valve on de engine. I tell him de only valve on de engine is de one de Boss called de trottle. He say, hang it man, I mean de valve in de steam chest. I tink dat McGee he been having some 2½ per cent. to talk about chests on de engine.

He ask me do I know how much lead and lap de valve him got. I start to laugh for I tink he joke me. I say sure McGee. I tie de string to dot valve and lead him around de mill and let him lap up some milk like a cat. Den McGee be get red in de face and say damn some times more. Den McGee ask me if it is good plan to put valve between boiler and safety valve, and I say, sure, because if I had valve dere I could shut him when de steam gets high pressure. He say damn again. He say to me I expect if de water got out of de glass and a big fire on you would run away. I say, sure, again, dat is just what I did do a little while ago. He say, see here Batistee, you no damn good as an engineer, go away and learn sometings and come back next year. Anyhow I am going to write to dose correspondence schools on Yongs street, Toronto, and pretty soon I will be a mail order engineer wid a salary of $3 a day, and noding for Sunday or overtime work. By gar, dere is a lot to learn in dat engineering.

The best blowoff valve arrangement is to place a quick-opening straight-way valve next to the boiler with an asbestos-packed iron body plug cock of the angle type at the elbow connecting the straight blowoff pipe with the main blowoff line connection.

The hottest part of the boiler furnace is just behind the bridgewall and frequently it will be found that more scale is thrown here than at any other point.

Principles & Practice of Mechanical Sketching & Drawing-IV

Every Mechanic Should Know How to Make and Interpret Mechanical Drawings and Sketches of the Simpler Types—A Practical Course Prepared Especially For Younger Men and Newcomers in the Industry

By Terrell Croft

ORTHOGRAPHIC PROJECTIONS

MAKE your drawing tell the whole story. Remember that mechanical drawing is a language, and that any working sketch which you may turn out is a graphic description of what is to be made or done. If the sketch is incomplete—if it lacks the requisite dimensions or views or details—the result is the same as when an author omits certain important words from his book. Be always certain that the ideas which you desire to convey are shown completely. Don't be selfish when you make a sketch, but consider that probably others besides yourself may have to work from or refer to it in the future. Details count for much in mechanical drawings.

If the thing is considered solely from the standpoint of economics it can be demonstrated readily that it is extremely wasteful to omit proper information from drawings. The pattern-maker, the machinist, the erector, and others down along the line may spend an aggregate of hours in ferreting out from a sheet facts which could have been incorporated in a few moments by the originator of the sketch.

Proportions and Perspective

Practically all working drawings are orthographic drawings, and the different "views" which comprise them are orthographic projections. While orthographic is rather a long and awkward word, it is used so frequently that it is essential the serious student of the language of lines (mechanical drawing) understands precisely what it means. It is the intention, therefore, to now examine the situation rather minutely. The underlying principle is very important because, as suggested above it is the basis of practically all engineering drawing. If a man once masters the principles which it is proposed to discuss, he will thereby be saved much future time and trouble—both in the making and in the reading of working drawings.

What the word "orthographic" means may be ascertained by referring to any standard dictionary. There it will be found that it is applied not only to drawing but to music and to grammar. In each case orthographic relates to the rendering of a thing in its true sense or true proportion. Thus, orthography in grammer relates to the correct spelling of words. Orthography in music has to do with the representation of tones and effects by the proper characters. An orthographic drawing is one which is in correct proportion.

There is a distinction between an orthographic and a perspective drawing. In an orthographic drawing (for example any ordinary working drawing) the lines are in their true proportions. In a perspective drawing the lines are not in their correct proportions although they appear to the eye to be so. If, in a perspective drawing the lines are in their correct proportions they will not appear to the eye to be correct.

For example, consider the perspective drawing (Fig. 1) of the steam chest cover. This appears to the eye to be in proportion and to be a fair representation of the object under consideration. However, since this is a perspective drawing it is really not in proportion. As shown in Fig. 2, which is a reduced reproduction of Fig. 1, the lines extending away from the realer intersect at a vanishing point P. It is apparent then that in Fig. 1 the line LG is shorter than the line EF, whereas in the actual object we know that these two lines representing edges would be of precisely the same length. Also in Fig. 1 GK is shorter than FJ, while in the actual cover they would be of exactly equal dimensions.

Orthographic Projection Necessary

From a consideration of the facts outlined just above it is evident that perspective drawings are not suitable for general engineering purposes for which it is usually desirable to represent edges, surfaces, and corners in their true proportions. But with orthographic drawings this requirement of true proportion is satisfied, as will be described.

FIG. 2—SHOWING HOW THE LINES OF A PERSPECTIVE DRAWING MAY IF PROJECTED INTERSECT AT A DISTANT POINT.

The function of a working drawing or working sketch is to show on one plane—the surface of the paper upon which the sketch is made—a picture of the object under consideration. The object which the drawing shows has three dimensions—length, breadth and thickness—while the plane upon which the drawing is made has only two dimensions, length and breadth. By utilizing the principles of orthographic projection it is, as will be shown, possible to plot on the apper plane a picture (usually comprising two or more views of the object in question) which will show it in true proportion and in all of its details.

An example illustrating how an object may be shown in orthographic drawing is given in Fig. 3. If the steam chest cover of Fig. 1 be observed with only one eye (E, Fig. 3) open, the observer, standing so that he is directly in front of the center of the object, will then see merely a rectangle (A^1 and B^1, Fig. 3). If now a sheet of glass, S_1, be inserted at right angles to the line of vision and on this glass a trace of the rectangular

FIG. 1—PERSPECTIVE VIEW OF STEAM CHEST COVER

outline as it appears to the observer be made with, say a pencil of soap, this trace, AB, will also be a rectangle. This rectangle will, obviously, be an orthographic drawing of the front of the steam chest cover because it is a reproduction in correct proportion of the front of the cover. But it is apparent that this one front view of the cover does not give sufficient information to enable a manufacturer who has never seen the cover to reproduce it in his shop. This front view tells nothing as to the depth or the contour of the body of the casting. If, however, another glass sheet (S_2, Fig. 4) be arranged directly over the cover and at right angles to sheet S_1, then the top view of the object can be traced with the soap pencil on this glass pane. The front and top views thus obtained give considerable information relating to the construction of the cover but do not define it completely. To insure more adequate definition another end view (E_1 and E_2, Fig. 5) can be traced if the cover is arranged in a glass box on the end of which the end-view trace is drawn with the soap pencil.

FIG. 3—ILLUSTRATING THE IDEA OF ORTHOGRAPHIC PROJECTION.

FIG. 4—TOP AND FRONT VIEWS OF STEAM CHEST COVER TRACED ON TWO GLASS SHEETS WHICH ARE ARRANGED AT RIGHT ANGLES TO ONE ANOTHER.

Complete Views

These three views traced on the faces of the glass box—the front view, the top view, and the end view—completely determine the over-all dimensions and the contour of the object. But, as drawn on the glass box in Fig. 5, each of the three lies in a different plane. If the information which these views convey is to be transferred to a sheet of drawing paper, all three of the views must some-

FIG. 5—THE STEAM CHEST COVER IN A GLASS BOX ON THE SIDES OF WHICH IMAGES HAVE BEEN TRACED.

how or other be transferred to the same plane. How this may be done is delineated in Fig. 6. The glass sheets upon which the end view and the top view were traced have each been swung through an angle of 90° so that now they all lie in the same plane with the sheet upon which the front view was drawn. In Fig. 6 these three views have been shown shaded to insure that they will stand out clearly. In the actual drawings on the glass the views would, of course, appear in outline as shown in Figs. 4 and 5. If a piece of tracing cloth or paper be stretched over the glass plates of Fig. 6, we could then trace on this sheet the orthographic drawing of the chest cover, which would appear as shown in Fig. 7.

Three different views are, as shown in Fig. 7, usually necessary to define adequately the proportions of an object. The front view is sometimes called the front elevation or vertical projection because it is a reproduction of the projection of the object on a vertical plane. The top view is also sometimes called the plan or the horizontal projection. The side view is sometimes called the side elevation or profile projection.

FIG. 6—HOW THE IMAGES TRACED ON THE SIDES OF THE GLASS BOX MAY BE ROTATED SO THAT THEY ALL LIE IN THE SAME PLANE.

How planes, edges, and corners are represented in orthographic drawings will for the most part, be evident from a consideration of what has preceded. Thus it is true that in an orthographic drawing, an edge is always represented by a line. If it is assumed that the line of vision of the observer is at right angles

FIG. 7—ORTHOGRAPHIC DRAWING OF THE STEAM CHEST OVER COVER TRACED FROM THE IMAGES OF THE GLASS PLANES OF FIG. 5.

FIG. 8—ORTHOGRAPHIC DRAWING OF THE STEAM CHEST COVER REARRANGED SO AS TO CONFORM TO STANDARD USAGE.

FIG. 9—ORTHOGRAPHIC DRAWING WITH THE DIFFERENT VIEWS BROUGHT TOGETHER BUT WITHOUT DOTTED LINES TO INDICATE HIDDEN SURFACES AND INTERSECTIONS.

FIG. 10—PARTIALLY COMPLETED ORTHOGRAPHIC WORKING DRAWING OF THE STEAM CHEST COVER

to the line, then the line will be shown in its true length. A straight edge or surface viewed at its end appears on the drawing as a point. A corner of the object always appears on the drawing as a point regardless of the direction from which it is viewed.

Invisible or hidden surfaces or edges are, when observed side on, represented

FIG. 11—HOLLOW BLOCK WITH INTERNALLY PROJECTING LUG.

in the orthographic drawing by dotted lines. No dotted lines are shown in Fig. 7. How they should be introduced will be treated later.

Arrangement of Views

In arranging the views in an orthographic drawing it is usually customary to place the top view in the upper left-hand corner of the sheet, front view below it, and the end view at its right, as shown in Fig. 8. This is ordinarily the preferable practice as it allows space in the lower right-hand corner of the sheet for the title. However, there is no reason why one of the other possible arrangement should not be followed, provided the ideas of orthographic projection are used consistently. Thus,

FIG. 12—THE COMPLETED WORKING DRAWING OF THE STEAM CHEST COVER.

Fig. 7 shows a perfect reproduction of the steam chest cover. It may at times be desirable to show above its plan view a rear view of the object and in addition a right-end view and a left-end view. Or it may serve more satisfactorily to show a left-end view without a right-end view.

To complete the orthographic drawing of the steam chest cover shown in Fig. 8 into a finished product, the first step would be to move the views closer together, which would result in the plot detailed in Fig. 9. Also the bolt holes, H, which have been omitted from Figs. 2 to 8, inclusive, to insure simplicity, should be included. Next, the dotted lines representing invisible surfaces should be incorporated. The resulting sheet will then appear as in Fig. 10. The importance of the dotted lines is apparent when one considers that unless these are shown one would not be able to learn from the drawing (Fig. 9) whether the depression ABCD extended entirely through the block as shown in Fig. 11 or only partially through, as shown in Fig. 1 and specified by the dotted line MN in Fig. 10. Finally to complete the drawing (Fig. 12) add the center lines, dimensions, dimension lines, arrow heads and title. Note (Fig. 12) how screw threads for the tapped hole T are indicated.

Number of Views Required

The number of views necessary to definitely describe the object in the picture language of orthographic drawing is a thing which must be determined for each case on its merits. For example, occasionally, as illustrated in the anchor-bolt example of Fig. 13, one view with appended notes transmits all of the data that is necessary. It is seldom, however, that one view of an object defines it sufficiently. If one considers that the general contour of the top views of the objects of Figs. 1, 11 and 16 would be precisely the same, the importance of this feature is apparent. A side or a front view would be necessary to show the difference in contours of the objects of Figs. 1 and 16. How the construction of Fig. 11 is shown by dotted lines to be different from that of Fig. 1 has been explained in connection with the discussion of Fig. 12. Certain objects, such as the cylindrical spacer of Fig. 14, can be shown, so that there is no possibility of misunderstanding their contour, with two views.

Another example of a two-view drawing is that diagrammed in Fig. 15, which

FIG. 13—AN ANCHOR BOLT. EXAMPLE OF AN ISOMETRIC DRAWING IN WHICH ONE VIEW TELLS THE WHOLE STORY.

shows the perspective view and the orthographic projections of a cast iron channel washer or plate which may be used for clamping shaft hangers or similar devices to a twin-channel girder

FIG. 14—PLAN, ELEVATION AND PERSPECTIVE VIEW OF CYLINDRICAL SPACER.

FIG. 17—CHANNEL OR 'I' BEAM FLANGE WASHER.

FIG. 15—DETAILS OF CHANNEL PLATE, CAST IRON.

or roof truss. An object necessitating three views for its perfect definition is the flange washer described in Fig. 17.

Isometric Example

An example of a three-view isometric drawing is given in Fig. 18 which shows the proportions of a casting which has been utilized very effectively in certain industrial shops and plants for supporting overhead motors and shaft hangers. These beams, for such they are, are clamped between two twin-channel

FIG. 16—RECTANGULAR BLOCK WITH EXTENSION PROJECTING FROM UPPER FACE.

girders which are erected for their reception. The construction thus provided is fireproof and very substantial.

Sometimes sections are used in combination with orthographic views to indicate the construction of an object. Fig. 19, which shows a cable or pipe-rack casting which is designed to hook over a bolt inserted through a web of a steel tee, constitutes a good illustration of this practice. The general subject of sectional reproduction and section lines will be treated in a future article.

LIQUID FUEL APPLICATIONS

According to one of the large oil companies, liquid fuel is to be found giving highly efficient service in bakeries, breweries, brass and other foundries, bedstead factories, bolt and nut works, boiler shops, cement works, cycle works, chemical works, dyers' works, drop-forging works, dynamite works, distilleries, engine works, elecricity generating stations, glass works, pottery works, railway works, steel rolling mills, sugar refineries, shipyards, tube works, tool works, tramway undertakings, waterworks, wagon works, and wire works. Amongst more or less unfamiliar processes in which it is used are tempering magnets, drying tea, smelting tin and ore, shrinking tires, soldering, heating rivets, distilling petroleum, bending plates, heating buildings, galvanizing, dust destruction, carbonizing lamp filaments, and singeing cloth. It is also used in many metallurgical processes in addition to those mentioned.

To face a cast-iron pulley with leather apply acetic acid to the face of the pulley with a brush, which will roughen it by rusting, and then when dry apply a cement made of one pound of fish glue and one half pound of common glue, melted in a mixture of alcohol and water. The leather should then be placed on the pulley and dried under pressure.

The fire point of an oil is the lowest temperature at which the oil itself ignites from its vapors when a small test flame is quickly approached near its surface and quickly removed. Since the fire point is always above the flash point the fire point value becomes of minor importance for this paper.

FIG. 18—CAST IRON MOTOR OR SHAFT HANGER SUPPORT TO SPAN ACROSS TWO CHANNEL GIRDER (THIS IS AN EXAMPLE OF AN ISOMETRIC DAAWING FOR WHICH THREE VIEWS ARE NECESSARY.

FIG. 19—CABLE OR PIPE RACK DETAILS. THIS SHOWS HOW SECTIONAL VIEWS MAY BE USED IN COMBINATION WITH ORTHOPEDIC PROJECTIONS TO CONVEY THE REQUIRED INFORMATION.

Efficient Appliances for Economic Shell Production—II

By J. H. RODGERS
Associate Editor Canadian Machinery

Radius Grinding Cutter.

While the production of the 18 pdr. has been discontinued here in Canada many devices were developed for the rapid and economic manufacture of this size of high explosive shell. A very interesting and serviceable device for the grinding of the boring cutters is illustrated in Fig. 9, and as this attachment could be easily applied to almost any make of small grinding machine, the same principle might very well be adapted to many other lines of similar work. The appliance consists of a base A that can be secured to the table of the machine. The upper portion of this base is fitted with a slide in which is placed the rest B, the top surface of which is inclined at an angle of about 6 degrees for grinding the clearance on the cutters that are held in a specially designed block E, which is provided with pivot hole so located as to revolve on the pin G to form the radius on either side of the cutter, the block being reversed to perform the operation on the opposite side. The cutters are held in position by means of the screw F.

Stops H and I are provided at the desired positions to regulate the travel of the block from one position to another, and also act as a guide when grinding the straight portion on the face or the side. Close adjustment is obtained by the screw J and locking nut K.

Unique Grinder For Shell Bore

It is seldom that the bore of the shells is sufficiently smooth after the finish tooling has been performed, and for this reason, and likewise to conform to the specifications it is necessary that some method be adopted to put a finish on the bore that will meet the requirement of the contract and pass the examination of the inspectors. The method generally adopted for this purpose has been to grind out the irregularities by some simple device constructed for the work. Many different appliances have been developed for smoothing the surface and nearly all of them have particular advantages that have kept them in continual service. As has been the case in all other impromptu appliances the available material about a plant has been the chief reason for the wide variance in the design of this and similar wheel E, a thrust ring F being fitted to the forward end of the shaft I which is supported in the long babbited tubing K, the latter being securely held in the casting L. A dust cap M is located on the forward end of the chuck. The grinding wheel H is fitted to the end of the shaft I which is supported in the equipment.

The device shown in Fig. 10 may appear quite complicated but it has proved very efficient and is of special interest owing to its unique construction and its method of operation. The supporting frame is made from two S shaped structural members held in position by the channel irons shown. Two solid steady rests are secured on one end that carry the large collet chuck D that is operated by means of the hand long babbited tubing K, the latter being securely held in the casting L. A dust cap M is located on the forward end of the tube to prevent the dust from destroying the bearing. A piece of cold rolled shafting is secured in the middle of this casting L, which acts as a plunger in the cylinders T T, one of these being located at either end of the machine and supported in suitable brackets—not shown. The adjustment of the cutting wheel is obtained by means of the nut Q that is fitted to a rod P connected to the bracket at the point O. The fixture is so arranged on the shaft R that by a simple movement the support together with the grinding shaft, can be swung aside to remove the shell from the chuck. The longitudinal feed for the grinding wheel is obtained by a combination of compressed air and oil, the latter being contained in a couple of spoiled 8 inch shells and so connected that the air supply coming through the pipe 2 is supplied at will to either cylinder by the control of the three-way

FIG. 9—RADIUS GRINDING FIXTURE 18 PDR. H.E. SHELLS.

FIG. 10—DEVICE FOR GRINDING BORE.

cocks 4, 4, these being so connected that they operate in unison. As the air passes through the pipes 5 and into the upper portion of the shell reservoir, the oil is forced up the pipes U and against the cold rolled shaft plunger. The speed of the movement can be regulated by adjusting the valve V whereby the flow can be adjusted to suit the desired conditions. This appliance while rather cumbersome has nevertheless given very good results.

Another Method For Grinding Bore

A somewhat simpler device designed for the same purpose is shown in Fig. 11. In this particular case the bearings for the grinding shaft is composed of two 11-inch hangers fitted to a suitable plank B, the shaft being operated by the pulley C. On the grinding end of the shaft is the piece D in which is supported the two arms E that carry the grinding wheels F; these are circular in shape and held in position by the small nuts shown. To renew the cutting properties of the wheels it is simply necessary to slacken the nuts and give wheels a slight turn. The carriage is composed of a wooden framework mounted on two small trucks that run in a parallel direction to the grinding spindle on the track H. It is very advisable that the axis of the shell when resting on the carriage should be central with the inner shaft, as any eccentricity would tend to destroy the regular operation of the fixture.

Three-Piece Boring Cutter

Boring bars are numerous in design but the general principal is invariably the same. In the one here shown in Fig. 12 the cutter is made in three distinct pieces, the portion used to form the base of the shell and the profile being located in the end of the bar, while the parallel section of the bore is derived by the two side cutters. The reason for this design was the saving that was effected in the use of high speed steel, as smaller bars could be used in making the cutters. The side cutters can be adjusted by means of the two small headless screws E. The cutting lubricant is distributed to the side by two inclined holes leading off from the central hole.

Three-Bladed Cutter Head

A three-bladed cutter that has given excellent satisfaction is illustrated in Fig. 13. The cutter head A, which is made of machine steel or cold rolled, is fitted by means of a screw and taper, to the machine steel bar B which is held in position in the turret or back rest of the machine. Three equidistant slots are milled out in the head A to receive the three cutters C C and D, the last one having an extension on the forward end for facing purposes, a suitable slot being milled across the face for support to this cutter. These cutters are secured in position by means of wedge blocks E and fillister screws F. The use of the three cutter method has a stiffening tendency and assists in steadying the cutter when in operation.

Finishing Inside Profile.

Following the nosing operation of the shells and for the same reason explained in a previous section of this article, it is necessary that any "irregularities in the interior, resulting from the bottling operation, should be removed before the shell can be accepted by the inspectors. Owing to the confined space that is now left for machining of any kind it becomes a difficult proposition to accomplish this purpose, particularly if the irregularities on the inner profile are very pronounced. The small opening left in the nose of the shell prevents the use of a boring bar that will be stiff enough to do any serious amount of machining, so that the bars that have been developed for this purpose are generally of a character that great care requires to be exercised in their operation. The one shown in Fig. 14 is similar to that used in a large number of plants, this being comprised of a solid bar so shaped as to give the maximum rigidity under the conditions present. In order to obtain the maximum holding power for the screws they are placed near the center of the bar, and for this reason the back edge of the cutter is provided with three slots through which the screws pass. The outer end of the bent bar is turned to receive the small roller shown that serves as a guide for the finishing position of the cutter, preventing the same from cutting below the point intended. Lubricant is forced to the cutter through the center of the bar and out through the inclined opening. In using these cutters it is necessary that the shank be removed from the support before the bar can be removed from the shell.

Special Inside Profiling Device.

A very interesting profiling device was developed by the engineers of a large plant for cleaning out the shell after the nose has been closed. The main body A of the fixture is made from a steel forging, the shank turned to fit the hole of a turret and additionally supported by means of the keyway B. The cutting tool C is contained in the slot cut in the center of the bar extension and is pivoted by the stud D, the outer end of the cutter swinging through a small arc and being a working fit at the point E. The device is operated by the handle F which is secured to the sleeve G threaded in the boss on the main holder. Through the center of the sleeve is fitted the bolt I, the ball head of which bears against the tail of the cutter. This tail is maintained against the head J by the action

FIG. 11. GRINDING BORE OF 6-IN. SHELL.

FIG. 12—BORING BAR HEAD

FIG. 13—FINISH BORING BAR.

FIG. 14—INTERNAL PROFILING TOOL. WATEROUS ENGINE WORKS.

of the spring P against the nut M which is locked on the screw K, which in turn passes through the sliding piece L. The adjustable screw N serves as a positive stop when the desired position of the cutter is attained. The retainer O is securely bolted to the main holder by means of the bolts Q. A small groove R in the forward end of the cutter allows the cutter to come back against the stop S, and when in this position the cutter is practically in the center of the bar, leaving the same free to be removed from the shell without removing the holder from its fixed position.

GEOTHERMIC STEAM GENERATION

The remarkable achievement of successfully utilizing underground volcanic heat for the generation of power in the neighborhood of Lardarello, Central Tuscany, Italy, naturally suggests the possibility of applying the same method in other localities. Such utilization of the internal heat of the earth, however, is dependent upon exceptional physical conditions, and it has occurred to an American engineer, Mr. Nathaniel B B. Wales, that these conditions could be produced artificially. The increase in temperature of the earth's strata in proportion to its depth shows a mean average for the entire earth surface of one degree Fahr. for every 55 feet of depth. There are many regions, however, where this increase in temperature is far exceeded. Hundreds of areas are to be found in the United States where the temperature rises one degree for every 20 or 25 feet of depth. There is a locality near Boise, Idaho, where three wells driven to only 400 feet yield 800,000 gallons of water daily at a temperature of 170°.

It is Mr. Wales's plan to sink a well-casing wherever the geothermic condition are favorable until a stratum of high temperature, say 350° to 450° Fahr. or higher is penetrated. Surrounding this shaft a number of other casings would be sunk. Water would be injected into the heated stratum through the central well-casing, and the head of the water would cause it to percolate through the surrounding strata, from which it would absorb heat and be converted into steam. The steam would then rise through the circle of well-casings surrounding the central water shaft, and could be employed for power or heat. In this way a large zone embracing several acres could be utilized to form the active heating surface, drawing heat through the contiguous rock from an enormous radiant rock contract and allowing an inflow of heat from millions of tons of the earth's mass. The permanence of such an evaporative surface is amply proved by the maintenance of hot artesian wells, which are to be found throughout the world.

There are many areas in this country where borings not over 5,000 feet would give the necessary temperature, and others of 1,500 feet or less would supply all the heat required. In some places thesteam generated might have to be used indirectly because of the earth salts held in suspension; but no doubt these salts could very profitably be recovered and would add to the value of the instillation.—Jour. Frank. Inst.

BUREAU FOR INVENTORS AT WASHINGTON NOW

The following statement is autthorized by the War Department:

In order to secure prompt and thorough investigation of inventions submitted to the War Department an "Inventtions Section" has been created as an agency within the General Staff. All inventions of a mechanical, electrical, or chemical nature submitted to the War Department for inspection, test, or sale are now considered by this section.

May be Sent by Mail

Inventions may be sent by mail or may

FIG. 15—INSIDE PROFILING TOOL.

be submitted in person, accompanied by written descriptions or drawings. They go first to an examining board having technical knowledge of the classes of inventions they handle, whose investigations determine whether the inventions have merit. Those with merit are referred to the Advisory Board, which determines in each case whether it should be put in the hand of some of the numerous testing and developing agencies, or if it should go to one of the staff or supply departments for test and consideration of its adoption, and final acquirement of title if such action is desirable.

When completed the board will have 12 to 15 members to cover fully all of the various technical problems which may come before it.

Assisted by Agencies

In testing and developing inventions and in considering problems presented by staff departments, the Advisory Board works in connection with a number of agencies. Among them are the following: Research Council; Bureau of Standards; War Committee of National Technical Societies (this committee consists of two members detatiled from each of the 10 important technical societies in the United States); laboratories and shops of the staff and supply departments of the Army; Patent Office; Aircraft Production Board; all Army Service Schools; C. L. Norton, Massachusetts Institute of Technology, Cambridge, Mass.; Dr. Charles P. Steinmetz, General lectrical Co., Schenectady, N.Y., etc.

Information for Inventors

Any person desiring to submit an invention for consideration, test, sale, or development should do so by letter, giving in order the following information: Name and object of the invention; any claim for superiority or novelty; any results obtained by actual experiment; whether the invention is patented; whether remuneration is expected; whether the invention has been before any other agency; whether the writer is owner or agent; the number of inclosures with the letter. A written description and sketches or drawings of sufficient detail to afford a full understanding of the cases should also be submitted. Should the invention be an explosive or other chemical combination, the ingredients and processes of mixture should be stated.

The Inventions Section will not bear the expense of preparation of drawings and descriptions, nor advance funds for personal or traveling expenses of inventors.

All Matter Confidential

Any matter submitted will be treated as confidential. The inventor will be notified of each step taken during the investigation of his invention. All communications should be addressed: Inventions Section, General Staff, Army War College, Washington, D.C.

AT ONE TIME ALL THE FILES IN USE WERE TURNED OUT BY HAND

THE MANUFACTURE OF FILES

By Mark Meredith.

For many years files were made entirely by hand, and at the present time the best files are still made in that manner. The file may be called a metal-cutting or abrasion tool, and it removes the metal by means of a series of sharp-edged parallel ridges, all inclined at an angle of about 50 degrees to the axis of the tool. There are numerous types of file differing in fineness of cut, and these are all divided into two broad classes of "double cut" and "float cut," or a "single cut." The former have two rows of cutting edges equally inclined to the axis and the latter have only one. In preparing the files steel blanks are first forged which have been previously sheared or rolled to the section required for the tool. This blank is, of course, of soft steel, and it is held on the anvil by means of a strap which passes round the tang and is held down by the foot of the operator. If the underside has been cut already, or is not flat, it is protected from damage by interposing lead or pewter as a soft support.

Then, using a chisel which is rather wider than the blank, the operator makes a series of cuts parallel to each other and at the proper angle. The hammer is chosen with great care to be of such a mass as to cause the burr from each cut to rise to the right height. The distance of one cut from the next is gauged by resting the inclined chisel against the last burr when cutting the next. By increasing the slope of the chisel the distance apart of the burr is increased and vice-versa. It is obvious that the greatest skill and practice is required to strike the chisel with the right force, and to keep its inclination constant over many hundreds of cuts. The height of the burrs as well as their distance from each other governs the fineness or coarseness of the cut. In the ordinary double-cut flat file there are 6 degrees of fineness respectively, called rough, middle, bastard, second cut, smooth, and dead smooth. Float-cut files are made in the rough, bastard and smooth varieties. In making double-cut files the first series of cuts are smoothed over very slightly before making the second series. Lancashire used to make the best files, and even now no place can compete with it for the finest files, such as watchmakers use. There is a file that has been made in Lancashire on which there were 300 cuts to the inch.

The rasp cuts in virtue of a number of triangular shaped projecting burs distributed over its surface. These are made with a three-cornered pointed punch or chisel. They are distributed as evenly as possible, the great object of the file-cutter being to arrange that one cut shall not come behind the other. There is thus great skill in arranging by the eye a pattern in which the number of cuts per square inch shall be uniform and yet in which they are rightly and irregularly placed relative to the axis of the tool. Rasps, again, are made in rough, bastard and smooth cuts.

The wide use of aluminum has brought into use files of the "dreadnought" type. In these the cut is single and is normal to the axis, or nearly so. It is very coarse and the teeth are deep and triangular in section. As a rule they are not straight, but are shaped in arcs or circles arranged parallel to each other. This coarse type of file is necessary because the aluminum being soft rapidly clogs the teeth of the ordinary file, making the edges so that they will not cut. For the purpose of filing up metal patterns, often on awkward concave surfaces it is best to take old files, and having softened them, to cut straight dreadnought type teeth on them with a three-cornered file. The files are then bent to suit the cavities and corners which have to be worked, and are rehardened by heating and plunging into oil. In this way a most ingenious set of tools can be made to perform all sorts of impossible jobs with ease and accuracy.

Returning to the orthodox file cut in the soft steel blank, the next operation is to straighten the file out accurately. It is then hardened, the teeth being protected from burning in the heating process. After hardening the quality of the cut is improved by exposure to a blast of fine sand.

Numerous attempts have been made even in the eighteenth century to devise machines to replace the hand file-maker. These all attempted to imitate his action by means of an arm carrying a chisel, the latter being struck by a hammer, which is operated mechanically. The successful machines of the present day carry the blank on a table which advances very slowly under a chisel or hammer which reciprocates rapidly. By varying the rate of the transverse of the table the coarseness of the cut can be altered. But it still remains a fact that the hand-operator can make the best file, and this is attributed curiously enough to the advantage of a certain amount of irregularity in the teeth of the hand-cut file which it is very difficult, if not impossible, for the machine to imitate.

"Dear Clara," wrote the young man, "pardon me, but I'm getting so forgetful. I proposed to you last night, but really forgot whether you said yes or nor."

"Dear Will," she replied by note, "so glad to hear from you. I know I said 'No' to someone last night, but I had forgotten just who it was."

In response to many inquiries from private persons as to the desirability of saving and selling old tin cans, the Department of Agriculture says it has been told by a detinning company that cans free from rust and foreign matter are worth $12 a ton, f.o.b. factory. It takes from 7,000 to 8,000 cans to weigh a ton, and the company says it is not advisable to collect the cans except in large towns.

DEVELOPMENTS IN SHOP EQUIPMENT

Makers of equipment and devices for use in machine shop and metal working plants should submit descriptions and illustrations to Editorial Department for review in this section.

THE "ALL-ANGLE" GRINDERS BROUGHT OUT AND MADE IN TORONTO FACTORY

The "All-Angle" universal grinder which has been perfected by W. J. Rennie, superintendent of the Toronto Type Foundry Co., Toronto, and is being built by this concern, is a new tool embodying a number of interesting features. The outstanding feature is the large variety of work that can be done on this grinder without extra attachments. All angles and tapers can be got by adjusting the grinding head and there is no necessity for using internal, cylindrical or universal attachments, thereby eliminating a large tool cupboard and also effecting a great saving in time in setting up the grinder for working. This grinder can be placed in any position in the toolroom as no belts or countershaft are necessary. The machine has independent motors which can be run on a lighting circuit. The accompanying illustrations show the general design of the grinder and location of attachments for certain classes of work. The grinding head is graduated to obtain any required angle in vertical or horizontal positions and by this means extremely accurate work can be obtained.

The grinding head consists of a motor mounted on a sliding fixture which can swivel on the drop head. The drop head is constructed so that it can be turned round to any angle as shown on the graduated scale or can be dropped down, or tilted over also to any angle as shown on another graduated scale at the back. The motor spindle which runs at 10,000 r.p.m. carries at the front end an external grinding wheel, while at the back end of spindle is a "C" attachment for surface or large internal grinding; mounted on top of the motor is a bracket carrying a belt-driven spindle running at 30,000 r.p.m. This carries an "A" attachment for small diameters.

GRINDING A MILLING CUTTER, HELD ON AN ARBOR. THE GRINDING HEAD IS TILTED TO OBTAIN CLEARANCE, THE EXACT CLEARANCE BEING SHOWN ON A GRADUATED SCALE.

The bent crank operates the sliding fixture to adjust the grinding head in position and there is also a screw for fine feed. The drop head can be locked in any position.

The table is in two parts, upper and lower. The lower part works in slides while the upper works on a pivot and can be set at any angle up to 10 degrees from zero either way; the angle being noted from the graduated scale at one end. The table is traversed by means of the upper hand wheel at the side and is provided with stops at the front fastened in a groove. The hand wheel has a graduated scale. The drive head can be equipped with a drive plate or chuck, or used as a headstock. When used as a drive head, it is driven by a motor attached to the table. Both drive head and motor are equipped with S K F ball bearings. The table also has a tailstock for certain operations. The centres will allow for a swing of 11 inches. The in and out motions of the table are operated by the hand wheel at the front. This wheel has a graduated scale for feed control. A useful attachment is the universal finger or tool rest. This attachment can be set in any position and at any angle.

The knee upon which the table os mounted can beswung around to any angle, the pillar having a graduated scale for noting the angle. The knee is operated in a vertical direction by means of a telescopic screw, by bevel gearing. The type of screw provides for a longer range of travel without measuring the height of the machine. The screw operating gear has ball bearings. The knee is operated by the lower hand wheel on the left side. The base of the grinder is box section and has four plugs, one at each corner for the motor connections.

For external grinding the work is held on an arbor or drive plate and the grinding wheel placed in any required angle or position. The machine is particularly well adapted for grinding steel profile gauges for shells owing to the peculiar form of the gauge and great accuracy required. For this work the former and work are held on an angle plate attached to the table and the grinding head placed in a horizontal posi-

GRINDING FACE OF A STEEL DIE. THE GRINDING HEAD IS SET OVER INTO THE VERTICAL POSITION TO NINETY DEGREES. THE MOTOR IS THEN TILTED TEN DEGREES TO GIVE A CONCAVE SURFACE TO THE DIE.

tion. The slide is left free to allow the former to raise and lower the grinding head. When grinding blanking dies, the table is set at zero, and the grinding head is set over into the vertical position to 90 degrees. The motor is tilted to give a concave surface to the die.

For internal grinding the work is held in a chuck or bolted to the drive plate. The grinding head is used in a horizontal position and turned round so that either the "C" or "A" attachments can be used, according to the diameter of hole to be ground.

The following specification gives some of the principal dimensions and features of the "All-Angle" grinder. The grinding motor is of the universal type built in any voltage from 80 to 300. The main spindle speed is 10,000 r.p.m., which is the same for the "C" attachment for internal and surface grinding. The speed of the "A" attachment for internal grinding of small diameters is 30,000 r.p.m. The driving motor is a variable speed universal ball bearing motor with controller for 20 speed variations. The controller is attached to the knee under the table.

Longitudinal movement of table, 18½ inches.

Cross movement of table, 7 inches.

Vertical movement of table below the grinding wheel centre, 19 inches.

Surface grinding vertical movement with grinding head in vertical position, 5½ inches.

Will take work 15 inches long and swing 11¾ inches.

Surface dimensions of table, 28 x 5½ inches.

Internal grinding, either straight or taper, from 5/16 to 10 inches in diameter and up to 6 inches in depth.

The table swings around the column through 360 degrees.

The grinding motor swings through a vertical plane of 90 degrees.

The grinding motor will slide in a plane parallel to its base to a depth of 5¾ inches, operated by feed lever.

The grinding motor, swivel base, and sliding base can be revolved 360 degrees. The grinding motor will revolve through 360 degrees in a plane parallel to and above the sliding base.

Floor space, 48 inches by 54 inches.

Net weight, 875 pounds.

Shipping weight, domestic, 1,000 pounds. Shipping weight, foreign, 1,250 pounds.

Shipping measurements, domestic, 5 feet by 2 feet 10 inches by 3 feet.

Shipping measurements, foreign, 4 feet 9 inches by 2 feet 4 inches by 3 feet 3 inches.

TRIPLE GEARED ENGINE LATHE

The triple geared engine lathe shown in the accompanying illustration, built by the Canada Machinery Corporation has been redesigned and improved. The lathe which is of strong construction is made in two sizes 36 in. and 42 in. swing.

It is equipped with four step cone and back geared drive and in addition with a triple geared drive direct to face plate. This arrangement combines great driving power and an ample number of spindle speeds. This lathe is a modern high speed tool of great strength and extreme accuracy. It is provided with a deep bed, giving maximum stiffness under cut. By means of feed box immediately below the headstock three changes may be instantly obtained. The saddle is substantial throughout with great strength in the bridge—the bridge having a bearing on the flat surface inside the V, in addition to the two V bearings. The machine in detail is as follows:

The bed is unusually deep and rigid, and is thoroughly braced with cross ribs of box section. It is provided with three inverted V's of liberal proportions. The headstock and the tailstock each rest on one V and one flat surface, and the saddle bears on two V's and also on the flat surface. The brackets attached

GRINDING ON SIDE OF A HARDENED STEEL PROFILE GAUGE FOR 4.5 H.E. SHELLS. NOTE THE POSITION OF THE FORMER AND WORK ON THE ANGLE PLATE. DUPLICATE GAUGES OF INNUMERABLE DESIGNS CAN THUS BE PRODUCED.

GRINDING THE HOLE IN A SPIRAL MILLING CUTTER. THE GRINDING HEAD IS SET OVER THE TABLE UNTIL THE "A" ATTACHMENT IS IN LINE WITH THE SPINDLE.

to the bed are made with a tongue fitting a groove in the bed, and the rack is securely screwed and dowelled to the bed.

Headstock throughout is unusually massive and is of the four-step cone triple geared to face plate type. It is equipped with split phosphor bronze bearings. The spindle is turned from our special high carbon spindle steel and has a hole bored from the solid throughout its entire length. It is accurately turned and carefully ground to size. The cone has four steps of extra wide faces to enable wide belts to be used, and in this particular we have more power in our lathes than found in other engine lathes of similar sizes. The saddle is large and rigid, having a bearing its full length on the V's. The apron is of the double walled type, there being a double bearing for all pinion studs. All gears in the apron are of steel. The handwheel is not geared directly to the rack on the bed but indirectly through a reducing intermediate gear to facilitate the movement of the saddle. When the lathe is used for screw cutting the rack pinion is drawn out of mesh by a knob handle on the end of the pinion stud.

Three changes of feed are obtainable through the feed box on the bed below the headstock. By changing the gears on the head and quadrant plate any desired feed may be obtained. It is impossible to engage either the automatic cross or longitudinal feeds when the machine is set for screw cutting, or vice versa. The thread on the lead screw is used for screw cutting only. The feeds may be instantly reversed in the apron by a convenient lever. The saddle is securely clamped when using the cross feed. The lead screw is reversed for right and left hand threads by means of the reverse plate on the head. The feed gears in the head are arranged so that quick threads up to 8 in. lead can be cut by putting on gear to suit.

Thread chasing dial, for indicating correct point for engaging nut for thread cutting, is provided on the carriage, obviating the necessity for stopping the lathe when screw cutting. Micrometer adjustment is provided on the handles of the cross screw, graduated in 5/1000's and 1 32's of an inch. Compound tool rest is provided, with base graduated in degrees.

Tailstock is rigid and heavy, and is clamped to the bed by two bolts conveniently situated. It is also provided with a pawl engaging in a rack cast in the bed, which serves to take the heavy strain of the clamping bolts and gives a positive brace when the machine is engaged on heavy work. The pawl is operated by a rod convenient to the operator. The shape of the tailstock is such as to permit compound rest to be set at right angles without interfering. The spindle is graduated in inches and fractions of an inch for use in boring. The tailstock is adjustable across its base by means of a screw to permit of its being set over to turn taper, the base bebing graduated for this purpose.

Standard equipment includes countershaft with two friction pulleys, necessary shifters, follow rest, steady rest, face plate, change gears and necessary wrenches. Special attachments, such as taper attachment, turret on the bed, or saddle, turret tool post, etc., can be furnished at an extra price when so desired. Motor drive.—The lathes can, if so desired, be arranged to be driven direct by constant or variable speed motor, or by single pulley drive.

The distance between centres, 14 ft. bed, for the 36 in. lathe is 6 ft. 1 in., and for the 42 in. lathe 5 ft. 11 ins. The weight of machine complete with 14 ft. bed is 15,500 pounds and 17,000 pounds respectively. For both machines the width of belt on cone is 5½ in., steps on cone 4, number of speeds to spindle 24, diameter of front spindle bearing 6 in., and length 10 in., diameter of rear spindle bearing 5½ in., and length 7 in., diameter of hole through spindle 3⅛ in.

36 AND 42-INCH TRIPLE GEARED ENGINE LATHE

BEVEL GRINDER AND AUTOMATIC MILLING SAW SHARPENER

The accompanying illustrations show two machines recently marketed by the Machinery Company of America, Big Rapids, Mich. Figs. 1 and 2 show front and back views of the bevel grinder. This grinder is suitable for theg rinding or sharpening of circular cutters or knives commonly used on meat paper, cork cloth, etc., and will grind from within 10 inches of centre to within ¾ inch. Thus a cutter of 4 inches diameter may be bevel ground to a maximum width of 1¼ inch.

General Description

The operation of the machine is very simple and all adjustments will be readily understood. A hand adjustment is provided for a quick centering of the cutter,

according to its diameter, for proper contact with the grinding wheel. A hand-wheel adjustment feeds the grinding wheel to or from the cutter, during the grinding process. A hand lever affords lateral movement of the grinding wheel across the surface of the cutter. The angle or degree of the bevel grind is adjustable to suit the requirements of cutters of different gauges, diameters, etc. The grinder is equipped with a water tank so that the grinding is done wet and tendency to heat and impair the cutter is avoided. An adjustable stop or back rest of fibre is mounted behind the cutter opposite the grinding wheel, which supports the cutter rigidly and prevents chatter or improper vibration. A guard is provided for the grinding wheel to prevent it throwing dust and water.

The grinding can be done very rapidly and satisfactorily, and if a cutter is but slightly dulled the time required for the grinding is negligible.

The machine is provided with every adjustment necessary to afford a bevel grind of any width up to 1½ inches on cutters not over twenty inches in diameter, and that sufficiently exceed a 3-inch minimum diameter to permit a bevel grind of required width.

The automatic slitting or milling saw sharpener shown in Fig. 3 was designed especially for regrinding and recutting slitting or milling saws 2 inches to 10 inches in diameter, usual spacing, and is especially well adapted to the reclaiming of very thing slitting saws with fine tooth spacings, which in the past on account of having no efficient means of resharpening have been discarded. With this grinder they may be resharpened repeatedly until the entire value is received from the blade.

Utility

The grinding of the teeth is absolutely uniform; the cutting points are kept perfectly "in spacing,' equalizing the strain on the saw, and keeping them always sharp and in perfect condition, insuring smooth, fast-cutting with reduced friction and heating of the blade in the cut. The action is full automatic, requiring very little attention on the part of the operator after being placed in operation and has a very rigid, strong body mounted on a substantial pedestal, bringing it up to a convenient height to the operator. All essential working parts are entirely enclosed in the body, fully protected from all dust, dirt and other foreign matter. All moving parts are provided with ample adjustments for taking up wear and insuring absolute accuracy of action and durable service without deterioration. The very best of workmanship is put upon this machine throughout. Any standard shape or spacing of tooth may be readily obtained by hand wheel adjustments conveniently located to the operator.

FIG. 1—FRONT VIEW OF BEVEL GRINDER. FIG. 2—BACK VIEW OF BEVEL GRINDER. FIG. 3—AUTOMATIC MILLING SAW SHARPENER.

QUICKLY ADJUSTABLE BENCH VISE

The Barnett Foundry & Machine Company, Irvington, N.J., has just brought out a machinist's bench vise under the name of "Wimans' New Idea Vise" that

QUICKLY ADJUSTABLE BENCH VISE.

embodies several novel features. Reference to the illustration herewith presented will show its general characteristics. It will be seen that the old fashioned screw and lever has been replaced by a pawl and rack. This is actuated by a handle on an eccentric shaft, which will exert a pressure many times that possible with a screw.

The adjustments from zero to maximum are made instantly with one sliding movement. The pawl eccentric and sliding jaw form a toggle joint, bringing the greatest pressure to bear on the top part of the jaws, causing the work to be clamped tightest at the working part. The moving member of the vise slides away from the operator and there is no handle between operator and the vise. The gripping plates are hardened and ground, and the rack and pawl are also hardened steel.

A feature of importance is that the whole vise may be removed from its swivel base and taken to surface plate, drill press or milling machine for continuous operations, since the base of the vise is accurately machined to right angles with the jaws. These vises are made in standard sizes of jaws from 3 inches to 8½ inches, and openings of 3½ to 12 inches.

A certain learned Queen's counsel was arguing a commercial case before a learned judge. In doing so he had occasion to speak repeatedly of an "eccentric," and the judge at length asked him what an eccentric was. The magistrate said he was familiar with the term as applied to individuals but not to things. The Queen's counsel at once complied. "An eccentric," he said, "is a circular disk whose centre is not in the middle."

A Strike That Should Not Have Been

THE business of a good many cities was interfered with when the postmen went on strike. Mails were held up, important orders cancelled and no small monetary loss resulted.

The department at Ottawa should never have allowed that strike to come to pass. The fact that it did was evidence of administrative incompetence.

The men were underpaid—grossly so, and the trouble was on the horizon a long time before it broke.

If any department of Canada's government is due for a rattling of dry bones, the finger points to the post office department.

Mistaken Idea of Secrets of the Trade

DID you ever come in contact with the mechanic who was always afraid that some person else in the shop would learn his ways and methods of doing certain jobs? The chances are that if you have had much experience you have met this chap several times over.

He has failed and failed miserably to grasp the idea that giving away knowledge does not make him any poorer, neither does the withholding of it make him any richer.

There are men to-day who might have developed into real good mechanics had it not been for the "stand pat" type of mechanic with whom they became associated early in their experience. This mechanic, perhaps a foreman, failed to make the trade interesting. He kept his ways and devices under a bushel. He always made it a plan to let the new man "go in and find out for himself." He may have done it to try and develop initiative in the men under him, but it does not work out that way. Apprentices came to him, they served their time, and they went their way. They might have been experts—they might have left that shop qualified to go in any place and begin work—they might have gone out knowing that they were "real mechanics." But they didn't. They may have dropped into better environment later on, when they would have a chance to develop the real things of the trade. But the fact remains that there are shops, and plenty of them, where the mechanics have not yet learned the great truth that it pays handsomely to make the young apprentice a capable hand before he leaves the shop.

There is another phase to this same situation, and that is the experience that mechanics can pass along and put on record through the medium of such papers as CANADIAN MACHINERY. The mechanic who has had experience that makes work easier, that brings better results for the firm, has a responsibility, and that responsibility is to try and bring others up to the same standard of efficiency he himself has reached. Firms are often forced to spend hundreds and thousands of dollars in experimenting to find out what some other group of men already know. The result is that industry—viewed from the larger scope in the national field—loses, and a tremendous amount of energy is wasted, all because the mechanic with the knowledge saw best to keep it to himself.

Remember this. You are not going to be any poorer because some person else knows as much as you do. It is not going to cut the ground from under your feet because you help some other chap to get the training that will enable him to hold down a good position and do the work well. Your reward will be greater than any that a paper can pay for your material. It will be in the form of satisfaction in having helped some person to make two dollars where he was making one, and in making a good mechanic out of the chap who is now being pitchforked out of the shop as a handyman.

Alberta And Its Big Problem

ALBERTA coal is surely having a merry time trying to make its bow to the people of Winnipeg. If all the energy that has been spent in investigating and reporting had been applied directly to the production and application of coal there would be quite a few bins filled to the ears by now.

Here's the way the situation is summed up in one of the numerous reports that have been issued:

> In this connection, it is claimed that the majority of Winnipeg dealers are absolutely hostile to Alberta coal, while a few who are genuinely boosting it are carried away by their zeal and led to extravagant claims which must result in dissatisfied consumers.

Now the thing most necessary seems to be a quota of dealers who will have just the right amount of thuse in their system. They must not blow off too hard or the consumers will expect too much. Neither must they be too frigid or the frigidity is likely to extend to the order books. Apparently it has not occurred to them to let the dealers get out and peddle coal like they used to pitchfork real estate bargains around.

But apart from what the people of Winnipeg think of Alberta coal, or what the operators think of the people of Winnipeg the fact remains that it's a long cry between the present production of Alberta mines and what should be forthcoming to meet the winter needs of Western Canada. One report just issued has this to say:

> That a short crop of wheat in Southern Alberta, and Western Saskatchewan will reduce the amount of coal consumed in that area.
>
> That the short crop will release much labor for the mines this fall.
>
> That the short crop will release sufficient rolling stock from the normal traffic in wheat to carry Alberta coal Eastward through the crop moving season, thereby averting the danger of a calamitous shortage of fuel in Manitoba.
>
> That labor conditions are intolerable, alien miners, instead of the operators, are actually operating the mines at present. In this connection the department of labor and the mine administrator are severely criticized, it being declared that their method of keeping the mines operating is to grant every demand, no matter how unreasonable, made by the miners.

When it is remembered that the West has about three months left before the coal burning season starts, it's a mild statement to remark that the situation west of the Great Lakes looks serious.

OUR idea of a man with great foresight is the chap who whacks moths out of his winter underwear while the thermometer shows 95 in the shade.

HAS FAITH IN CANADA

American Has Developed a Nice Selling Business For Steel Trade in Canada

IT seems to have been the trend in recent years, and especially in connection with the industrial development of Canada, that the drift of steel men has been northward. This is true in connection with the actual operations in the steel plants as well as with the sales end of the steel and iron business.

Ralph B. Norton, Canadian agent of the Kayser, Ellison & Co., Ltd., Sheffield, England, was born in Essex,

RALPH B. NORTON.

Mass., in 1880, his parents having come previously to that country from England.

Shortly after leaving school he entered the steel business in the employ of the New England agent of Kayser, Ellison & Co., Sheffield, and the Crucible Steel Co. of America. For 13 years he was connected with this branch through its various offices, becoming conversant with all lines of steel and making a special study of alloy steels. He travelled extensively through Eastern United States and became one of the best known steel salesmen in that section.

While in Sheffield in 1913 Mr. Norton accepted a commission to open a branch for Kayser, Ellison & Co. in this country. Although this mill was one of the largest and most progressive in Sheffield, it was not so well known here, but in five years' time by untiring work, perseverance and up-to-date methods he has brought this new branch to a par with the older established English firms.

On the outbreak of war and the curtailment of English shipments, his acquaintance with the American steel manufacturers and sources of supply enabled him to take care of his ever-increasing trade. Mr. Norton is of a genial disposition, and has won a host of friends both in the East and in Ontario, where he contemplates opening a second branch.

He became greatly attached to Canada, and is full of praise for the way our Canadian manufacturers have risen to the call for greater production in every line. He is confident that any difficulties arising in business conditions through adjusting ourselves to times of peace will be met in the same unconquerable fashion.

SCORES THE "DEAD ENDS"

Invesigation Into Causes of Some of the Recent Fires That Have Occurred in Toronto

THE deputy fire marshal for Ontario, Geo. F. Lewis, conducted an investigation into the Thor Ironworks fire. The matter of its possible origin was gone into at some length, also the methods employed in fighting it, water pressure, etc. Considerable evidence was brought out regarding the employment of foreigners and the need for rigid care in this regard.

The part of the greatest importance, however, was that applying to the fire fighting forces and the supply of water. The "dead end" situation in water mains is one that probably exists in every city, and what applies in Toronto will have equal force and warning in other centres. One matter that was brought out in the investigation was the fact that it was quite possible for foreigners or any person, for that matter, to enter certain parts of the works at any time, a practice, which in the opinion of the investigators, should be curtailed as far as possible in times like these.

The Shortage of Water

In connection with the actual circumstances of the fighting of the fire, Lieutenant Mitchell on being examined stated that the first line of hose was connected with the hydrant at the Thor Iron Works gate, and with that he fought the fire from the water front side till their hose caught fire and they were cut off. It was shown that for about six minutes the pressure on the first line of hose was alright, but as soon as additional lines were laid they took away the pressure. It was even established that when the pressure started to go down they could only hit about the bottom of the second floor and it continued to drop until their hose was burnt and they were cut off entirely. The department that was fighting the fire at the Thor Works had to depend upon the Bathurst and the Spadina main. The hydrant at the foot of Spadina about fourteen hundred feet distance was also used. It is on a five-inch main and also a "dead end," so that all the water the fire department had to fight the fire with was from 2 six-inch mains on "dead ends." The Spadina Ave. connection wasn't much good as a fire fighting proposition either on account of the friction. There would be very little pressure after the water got through the 1,600 feet of hose running from Spadina Ave. to the scene of the fire.

The Evidence of the Chief

The chief of the Toronto Fire Department himself in giving evidence said, "that the big trouble was we didn't have enough water. The firemen were hampered by the lack of hydrants, bad roads, as well as lack of water, together with the necessity of laying long lines of hose." The chief also added that there was no reason why that plant would have been entirely burned like that if we had had roadways and the water. It was also brought out by the chief that he had applied to the Water Works Department of Toronto for blue prints showing the location of hydrants and sizes of mains in the various streets throughout the city, and had not yet got them and was thus without the proper scientific knowledge from a fire fighting standpoint of what he was up against.

At one time during the investigation Mr. Lewis, the deputy fire marshal for the Province, asked the fire chief this question: "If you had had proper water pressure at these fires the chances are it would have reduced the fire wastage enormously?" and the chief answered quite frankly to this that it would have made a wonderful difference.

William Corbett, district chief in the fire department, in his evidence went on to show that the fire department was badly hampered on account of bad and crooked roads, and insufficient water supply in fighting the Thor Iron Works fire, together with the delay caused by laying

Continued on page 76.

MARKET DEVELOPMENTS

War Industries Get the Preference

Firms Making Other Lines Are Having Hard Time Securing Supplies From War Trade Board—Small Chance of Any Material For the Commercial Users of Steel

THE Canadian manufacturer who is not working on war orders is not faring well in some cases, and the future has not much in store for him if he has to come to the War Board asking for supplies. True, the situation is not one that has developed over night, but the drift in that direction has been gradual and very persistent for some weeks, until now in some industrial for pig Iron had been turned down by the War Trade Board. centres it is being quite marked. Only this week one manufacturer in Toronto was informed that his request His lines are soil pipe, fittings and boilers for stoves. At present his firm has enough material on hand to run for six weeks, but at the expiration of that period he will be out if he cannot secure assistance, or turn quickly to other lines that will find favor with the War Trade Board.

There has been a feeling in the steel trade that about this time of year there would be some steel for distribution to the commercial users. It had been thought that after a three-months' concentration on war work the demands would have been overtaken. Just how far this guess is wide of the mark is shown by figures given out to-day in United States. It appears that the estimates of the requirements of the war group there for steel for the second half of 1918 will be 20 millions tons of steel, while at present the mills are only producing at the rate of about 16 million tons for that period. There seems to be little prospect of bringing production figures much past the point where they now are. From this it will be seen that there is small chance of commercial users of steel either in Canada or United States getting any supplies this year.

The fortunes of war bring many peculiar turns in the market. Only a few weeks ago the talk was about the great quantities of steel rails at Vancouver on order of the Russian government. This week in New York some 200 large machine tools are offered to the trade because they had not been shipped to their Russian orders. And it is also reported that agents from industrial and government quarters in Brazil are in American cities this week asking about the chances of securing machine tools for the manufacture of munitions to the order of Brazil.

The demand for pig iron and scrap is not satisfied in Ontario or any part of the Dominion. At American points it is being cornered for war work absolutely. A survey was recently taken in United States, as a result of which some 300,000 tons of pig were taken from non-war industries and turned over to firms that were working on essential contracts.

MONTREAL SEES NO CHANGE OF STEEL BEING SERVED FOR COMMERCIAL PURPOSES

Special to CANADIAN MACHINERY.

MONTREAL, August 1.—Continued hot weather has somewhat affected the tone of regular operations, and this is reflected in almost every line of activity, in particular, those industrial plants working on the production of furnace steel. Rolling mills and steel foundries have experienced a strenuous week owing to the continued hot wave. Machine tool trade has shown a languid tendency but the volume of business has been quiet heavy, owing to the early requirements of shell plants now under construction. Metals have had a comparatively quiet week with prices well maintained. Old materials are without feature at steady prices.

Production Slightly Reduced

As generally expected during the summer months, the output from the steel mills throughout the district has shown a falling off, and should the extreme hot weather continue this feature will become additionally emphasized during the coming weeks. Another factor that materially affects production is the holiday season when many are away from the offices and factories. Steel, both in the form of bars and billets for the recent renewal orders for shrapnel and high explosive, is being made in larger quantities. During the past few weeks it has been rumored that steel would be more easily obtained for other than essential war work, but as stated in previous letters, the situation has shown no tendency to change towards a more favorable distribution of steel; as a matter of fact the increasing demands in the United States for all classes of war supplies has resulted in reducing any quantity that might appear available for non-essential consumption. The abnormal requirements, however, make it very difficult to acquire steel for ordinary purposes, but owing to the indirect bearing that all existing activities have to the actual prosecution of the war, the business that might be termed of no importance is very hard to define. It is this condition that increases the necessity of careful supervision in the distribution of the output from the mills.

While it is possible that some action may be contemplated, on the part of the Canadian Government, in the matter of some form of price regulations, it is not taken seriously by the steel men here. The comparative volume of material that is produced in Canada to what is received from American mills, makes the regulation of steel prices here a very difficult problem, and one that could not very well be solved satisfactorily under existing conditions. Dealers here report a quiet period, largely as a result of weather and the holiday season.

Prices continue firm and unchanged on a market that is exclusively confined to war activities.

Features Developing in Metals

The week has passed without any local developments and the markets continues steady and firm. Interesting features however, are looked for in the near future owing to the movement in copper circles regarding a further revision of price, and to the uncertainty prevailing in tin, as a result of recent restrictions imposed on shipments of metal from is very heavy, exceeding the visible supply. Lack of inquiry has weakened the spelter market. Antimony is stronger with aluminum steady.

Copper.—Further agitation for another advance on copper has created a situation similar to that prevailing just prior to the last recent revision, so that the general tone of the market, if it may be termed such, is one of uncertainty, coupled with a nervousness on the part of the trade in covering their requirements. Few sales are made apart from price at time of delivery, so that those consumers with sufficient for immediate requirements are reluctant to place further orders under these conditions. Local dealers report a good business with supplies hard to obtain. Quotations are firm at 30½ and 31½ cents per lb.

Tin.—Developments at the source of supply are taking a turn that may eventually result in materially affecting present uncertain conditions, and these developments will not tend to ease the tension of the past several months. Closer regulation of shipments of Straits tin will mean a further period of nervousness, particularly on this side of the Atlantic. Dealers here report a declining supply but are able to satisfy customers for their most urgent requirements. This week's quotation show a stronger a stronger situation, the 5 cent advance placing the price (nominal) at $1.15 per lb.

Lead.—The heavy demand for lead and the evident scarcity has created a stronger undertone in this metal. Dealers here continue to quote 10½ cents but look for a stronger market.

Good Business in Machine Tools

While the present demand for equipment is not excessive, the dealers and manufacturers are actively engaged in placing machines that have been on order for some time. The rapid progress that has been made in the erection of several local munition plants, to take care of American and new shrapnel orders, has required the speeding up of machinery delivery. This equipment is coming along in good volume and it is anticipated that little delay will result after the completion of the buildings. New tools are the ones particularly in demand but very good business has been done in used equipment. One machinery house here recently disposed of the entire shell equipment of a large locomotive plant, the total value approximating $250,000. Much of this machinery was absorbed by other plants in the district. Local builders of special shell machinery are very active. Demand for all classes of supplies continues very heavy.

POINTS IN WEEK'S MARKETING NOTES

Reliable figures compiled in the United States show that the war requirements for the second half of the year will be twenty million tons of steel, while the output looks to be about sixteen and a half million tons. This would indicate that there is a very small possibility of any steel being left over for commercial users.

—

Although the story has been in circulation ever since U. S. began to manufacture war material that there was sure to be a labor shortage in the steel industry, the fact remains that at the present time in spite of recruiting, and all other drains upon labor, that the mills and furnaces are all very well furnished with labor.

—

A list of some 200 machine tools which originally sold through Russian firms, have been placed on the New York market.

—

Agents from Brazil are now in New York getting figures from dealers there on a number of tools for munition work in Brazil.

—

United States steel men are all agreed that it is not advisable to build any more furnaces there at the present time

—

As a result of a survey of the available pig iron in the U. S. some three hundred thousand tons were taken from plants working on non-essential contracts and given over to plants that were filled up with war orders.

—

Several Ontario firms have been notified that their request for a supply of pig iron have been refused by the war trade board.

—

Several of the large producers in American points have notified their old customers that if they wish to secure allottments of pig iron for 1919, they will have to get their plants into shape to handle war contracts.

—

A record is made this week in an unusual way, in that no changes are recorded in the market prices of steel or iron.

NON-WAR INDUSTRIES CAN'T GET SUPPLIES

Pig Iron Being Cut Off and Saved for Group of War Industries

TORONTO.—From time to time the statement has appeared that there was a tightening up in the supply of basic materials to the various institutions in the Dominion. Although a great deal does not appear on the surface, evidence is occasionally found which goes to show that the supply of such materials as pig iron is being dealt out to the war group in quantities in keeping with their needs. In fact it is seldom that a complaint is heard from any of these firms that they are being held up for want of material. There is a fairly good system worked out by which the War Board keeps the situation pretty well in hand.

Other firms are not faring so well. The representative of CANADIAN MACHINERY has met several outside foundrymen this week who were in the city in search of pig or good scrap. They are not being well served, and in some cases the supply has diminished to such a point that a temporary shut-down is in sight unless something comes along to relieve the situation, and that something is very uncertain at the moment.

Just to-day one firm in Toronto, manufacturing hardware supplies, soil pipes, fittings, stove boilers, etc., was turned down in its request for pig iron. This firm has enough material on hand to run along about six weeks, and unless it can go over to war work, the prospects are for a shut-down for a time at least.

Steel Prices Hold

No changes are made in any of the quotations in the steel market to-day, and indications point to a continuance of values that have been named for some days. From information received at this office it would seem that there is a fairly large amount of structural building waiting until there can be a supply of material for that purpose. Inquiries have been made at several of the firms dealing in structural steel, and the information is invariably given that it is useless to put in the order at Ottawa, for the simple reason that the War Board will not entertain it.

Conditions in United States are reflected here to a large extent. In a recent survey made of the pig iron situation there, some 300,000 tons of pig iron were found in the hands of industries that the War Board there refused to recognize as "essential." Recognition being denied them, this amount of material was confiscated and placed with firms that were working on strictly war contracts. No such action has been taken here, because supplies are hardly allowed out in proportions large enough to permit of such a situation.

Scrap Metals

There is very little trade moving in the scrap metal market this week. Dealers are keen to secure anything in the nature of good foundry scrap for the

demand for it is very marked. As a matter of fact, though, users of materials that usually go into scrap in the course of time are holding to them now, as the cost of replacement is a feature that they have to consider. Railroads in Canada are following the same policy as those in the States, and they are making their stock work overtime to cope with the transportation problems that they are facing.

Although prices for copper scrap, turnings and wire advanced quite sharply in sympathy with the new fixed price in United States, dealers do not report any larger amounts coming into the market.

Occasionally the question of reclaiming tin comes up. No doubt the $1.25 per pound price at which tin is moving has something to do with the agitation to reclaim certain portions of it. There is nothing of a practicable nature in the proposal as far as this country is concerned. It would take between seven and eight thousand tin cans to weigh a ton, and the value of the cans would be about $12 at the factory, according to present prices.

In Narrower Margins

Dealing in copper is coming gradually into a smaller compass. Dealers are not able to go into the market and buy all they want. There are limits now, and they are very closely defined, with the consequence that the available supply of copper is becoming scarce.

Prices for certain kinds of copper, for special uses, are advancing very much in excess of the price for the commodity fixed by the authorities. For instance, copper in the form used by photo-engravers is a hard thing to obtain and prices on that line have been advanced quite sharply, the result being higher prices for printing illustrations, etc.

Dealers here report only one minor change in market quotations, lead having moved up a half cent per pound.

Machinery and Supplies

Machinery for munitions plants comprises the principal class of business moving now. In this connection it is interesting to note that the Leaside Munitions Co. are proceeding with the construction of a new plant for machining 12-inch shells. Orders for a considerable amount of the machinery have been placed and also the contract for the transmission equipment. Local dealers report business as being fairly good but with a quieter tendency. Express shipments continue slow and are not much quicker than freight shipments.

An advance has been made in electric weld-proof coil chain. New prices now named range as follows: 3/16 x 5, $18.25; ¼-inch, $15.65; 5/16-inch, $13.15; ⅜-inch and larger, $11.90. A corresponding increase in other sizes and qualities has also been put into effect. Practically the entire line of the Stanley Rule and Level Co.'s goods has advanced. Prices generally on machine shop supplies are holding firm, with a shortage in some lines.

BRIEF REPORTS ON SCRAP AND PIG AT BIG PRODUCING POINTS

Reports on the pig iron situation in the various industrial centres are as follows:

Pittsburgh.—The survey of the pig iron supply recently conducted has resulted in close to 300,000 tons of iron under contract to certain consumers being taken from them and given over to companies working on big war contracts.

Chicago.—The smelters in general have enough iron with which to carry on current operations but some of them are not sure how they will fare when their present stock is exhausted.

Birmingham, Ala.—The inquiry for 1919 delivery has increased but the booking of orders has not resulted. The making of tentative agreements with the understanding with regular customers that if they shall be on war work in 1919, the iron will doubtless be forthcoming, is about as far as the producers have gone. A large company has issued notices to customers informing them of the necessity of getting on a war basis at once if they wish to be considered in the list of 1919 iron customers.

St. Louis.—Stove foundries are badly in need of pig iron and a considerable tonnage could be disposed of to these plants if the same were available.

Buffalo.—At the present time Government work is taking up practically the output here, but the furnace men hope later on in the second half to have some iron for distribution on old contracts.

Philadelphia.—The producers of pig iron here are not showing any great readiness to take on 1919 business, for the reason that they are not certain that their products will go to the parties to whom they sell. It has been their experience that large quantities of their material have been taken by the Government and sent to parties who have not been customers of theirs in previous times. And at the same time their own trade was neglected.

Cincinnati.—An investigation of the situation affecting the stove makers reveals the fact that very few of them in this territory have sufficient to carry them through the year.

New York.—The general opinion here seems to be that there will not be a pig shortage and at the present time shipments are moving forward satisfactorily so that few complaints from the melters are heard.

The Scrap Metal Reports

The reports on the scrap metal situation from the various industrial centres are in part as follows:

Pittsburgh.—As a result of the recent movement on the part of the authorities to bring all available scrap on the market, a good quantity of this has been found, but the trouble is that much of it is from very remote points. Whether it will be moved or not is a question that has not been settled because the freight rates to bring it to the smelting points would be very high. There is a very decided scarcity of steel, making scrap and the quantity of material is getting past what in ordinary times would be quickly rejected.

Chicago.—More steel scrap should be coming out and that it is not is charged to indifference which should not exist at this time, and a continuance of this attitude may lead to a serious shortage.

St. Louis.—Some of the railroads are offering small lots of scrap from day to day as they accumulate, or as they can be picked up with the short labor supply. Firms that are filled up with military work seem to have very little difficulty in securing smelting material.

Buffalo.—The demand for scrap is particularly heavy and largely exceeds the supply. Numerous inquiries are still unsatisfied. Heavy melting steel also continues in demand at a rate that exceeds the supply.

Cleveland.—It is said that many foundries would be glad to use a larger proportion of scrap in their mixture than at present. They are unable to do so as most of the pig iron that is being supplied is low in silicon.

RUSSIAN ORDERS NOW ON MARKET

Tools Made in States Were Never Shipped to the Eastern Land

Special to CANADIAN MACHINERY.

NEW YORK, Aug. 1.—Makers of guns and shells have placed contracts for machinery in the last week calling for the expenditure of $3,000,000 and similar contracts are pending involving the expenditure of $5,000,000. Manufacturers of aircraft and builders of ships have also placed substantial contracts for machine tools and other machinery. The conversion of many metal working shops in the Central West into war munition plants is resulting in a steady stream of small orders for shop equipment.

The Otis Elevator Co., New York, is about to place orders for 165 machines to be installed in its Yonkers, N.Y., plant for the manufacture of recuperators on gun recoil mechanism. The Himoff Machine Co., Astoria, N.Y., that is making gun mounts, is buying boring and other heavy machinery. The American Car & Foundry Co. is seeking to place an order for 132 24-inch lathes for the turning of shells to be installed in its Cincinnati plant. The same company recently purchased 150 heavy type lathes with the Niles Tool Works Co. Hamilton, Ohio, for the turning of large projectiles for the United States Government.

Big 12-inch Orders

The Maxwell Motor Co. has received an additional contract from the Government for the machining of an enormous quantity of 12-inch shells. The contract price is approximately $40,000,000, making this company's total war business $75,000,000. To expedite the work, the Government will give financial assistance

64 Front Street West - . - TORONTO

in building a $4,000,000 addition to the company's plant at Detroit. The Winchester Arms Repeating Co., New Haven, Conn., is buying $500,000 worth of shop equipment to make additional Browning guns for the Government. The New England Westinghouse Co., Springfield, Mass., has bought tools for gun-making and the American Can Co., Edgewater, N.J., has purchased supplementary tools for shell work. American Radiator Co., Bayonne, N.J., is buying additional machinery to increase the output of guns.

These Didn't Go Over

A list of 200 miscellaneous tools which were originally sold to Russian manufacturers has been made out by a local dealer who is now offering the machinery to American manufacturers, as the tools were never shipped and are still carried in New York warehouses. The Brazilian Mission is getting figures from New York dealers on a number of tools for munition work in Brazil.

The Scullin Steel Co., St. Louis, which is building a munition plant for the War Department, has awarded a contract for forge shop machinery to a Cleveland manufacturer.

The Mobile Shipbuilding Co., which has been building wooden ships for the Emergency Fleet Corporation, has received a $12,000,000 contract to build twelve 5,000-ton steel ships; each boat will require 1,670 tons of steel plates and shapes or a total of 20,000 tons and bids are now being taken on the fabrication of the full tonnages of steel, but it is possible that half of the tonnage may be fabricated at Mobile where additional shops and also three more shipways will be constructed. Cranes and machinery for the new plant will be purchased in the near future.

The Bethlehem Shipbuilding Corporation is planning to build two more shipways at its Moore works, Elizabethport, N.J., and also three additional ways at its Sparrows Point, Maryland, plant. Ocean going tugs will be built at Elizabethport and cargo ships at Sparrows Point.

Have Large Orders

The Todd Shipyards Corporation, New York, recently received an additional $15,000.000 contract from the Emergency Fleet Corporation to build twelve 7,500-ton freight boats which will be constructed at Tacoma, Washington. The Government contracts now held by the Todd interests amount to $75,000,000. Several new shipbuilding companies have been incorporated. including the Fabricating Ship Corp., Richmond, Va., with a capital of $1,000.000, and the Connecticut Shipbuilding Corp., New Haven, Conn. The Baltimore Drydocks and Shipbuilding Co. is making plant additions and installing new machinery.

A ¼-inch high-pressure cold water connection to the space below the discharge deck of a pump will prove a quick and effective remedy for vapor bound pumps, also an automatic valve is sometimes connected to this space for exhausting the air or vapor.

THERE'S NO CHANCE FOR STEEL BEING LEFT FOR COMMERCE YET

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., Aug. 1.—There has been considerable discussion in steel trade circles the past week of the War Industries Board's general statement, mentioned in this correspondence a week ago, that the war requirements in finished steel for the second half of the year are fully 20,000,000 net tons, while the prospect, based on past performance, is for an output of 16,500,000 tons. The trade does not doubt that there are items which make up a total of 20,000,000 tons or more, but in some quarters there are doubts whether the consuming activities can actually utilize the amount of steel they are calling for, by the end of the current year. The time element, they insist, is precisely as important as the tonnage element. Particular attention is being directed to the fact that while as to the direct war activities the War Industries Board has its records of orders placed and its schedules of orders to be placed, in the case of the commercial industries that are given preference and should be supplied with steel it can have no information of corresponding character, but must depend upon estimates. If the direct war activities, involving the steel the Government itself buys, were to count up 20,000,000 tons, then there would be no use in including the "more essential" commercial activities in the preference list, for that would be an altogether empty honor. These essential commercial industries, including those engaged in the production and preparation of food, in the production of fuel and in the manufacture of clothing, together with the public utilities in general, are all expected to get steel, and more or less according as the supply stretches.

Nothing for Unessentials

One thing has been made quite clear, that there will be little if any steel for the "unessentials" or "less essentials," these terms being used more or less interchangeably. In the first place, the supply will not stretch through the preference list, involving Class C steel, and then into the miscellaneous or unessential demands, such steel being designated as Class D steel, when there is any. In the second place, these consuming industries that are not accorded any preference represent a very small quantity of steel in the aggregate. If only they are to be denied steel there is not much steel saved. Various attempts have been made to compile a list of the "unessentials" but the compilers get nowhere. They start out, with a great flourish, by setting down "pleasure automobiles," not calling them "passenger automobiles" as the producers insist upon doing, but when they come to the next line and the lines following they have to leave them blank. The "preference list" is so comprehensive that there is scarcely anything left. There are items of demand that in normal times would be very important, but the industries involved have almost completely effaced themselves, with the country on a war basis, partly voluntary and partly forced by influences.

The problem of steel distribution, therefore, is to make the steel last down through the preference list, not to have it extend beyond.

Labor Conditions

There being so little that can be done to improve the distribution of steel, attention is directed more to production. It is regarded as decidedly not feasible to build additional plants. That would require a great deal of time and consume labor, materials and transportation facilities. What is of more importance is to obtain maximum production with the plant equipment now available. The problem is largely one of labor supply and labor performance. It is remarkable that the iron and steel industry is in as good shape as it is, when it is recalled that ever since the fore part of 1915 there has been more or less of a "labor scare." It will be recalled that the industry reached an unprecedently low rate of operation towards the close of 1914. Then early in 1915 conditions began to pick up. As demand increased it was seriously contended that there would not be sufficient labor to operate the furnaces and mills at capacity, should demand arise such as to warrant full operation. Some labor had left the country on account of the war in Europe, and immigration was practically stopped, although prior to the war the net increase in population, due to the passenger movement, had been about 60,000 persons a month for two years. Throughout 1916, although operations at capacity had been reached, there were fresh scares. Then when the Government began drafting men to the colors the whole thing had to be gone through with over again.

Nevertheless the condition to-day is that the mills and furnaces are fairly well recruited with labor. There have been various offsets to the drain of labor, and nearly the whole of the offset can be traced to the wonderful work the Government has been doing, through various important activities. It created a Labor Policies Board which should devise means to secure the best performance. As a result of its deliberations the United States Employment Service is now being put into operation throughout the country. Employers engaged in war work and employing 100 men, are not permitted, after August 1, to recruit labor except through this one service. Its methods promise to be drastic, calling upon non-war industries to give up men. Then there are the conciliators of the Department of Labor, who seek to catch cases of industrial unrest, or strikes being fomented, in their incipiency, and many a strike has been averted, or speedily settled, by the work of

SCORES THE "DEAD ENDS"

(Continued from page 153)

long lines of hose. The fire itself was not of an extraordinary or very serious character from a fire fighting standpoint when the department got there.

Too Many Dead Ends

William Randall, the Toronto superintendent of maintenance and distribution of the Water Works Department submitted certain plans, and in answer to questions put to him it was brought out that in the city there are at the present time no less than 556 of these "dead end" water mains. It is well known that it is impossible from a fire fighting standpoint to secure the same pressure from a dead end main as it is from a main through which there is a constant flow of water. One of the questions in regard to the Spadina Ave. service brought out a remark to this effect, "They practically had no water there at all," and the answer to this was "no" because the water was used by the engines on Bathurst Street and on the lines that were connected up on this hydrant, before it ever could reach that branch.

A New By-law Needed

The deputy fire marshal in conclusion draws attention to this report to a number of things he considers to be very essential in keeping the fire loss down, among other things mentioning smoking on premises, grass fires, old shacks as a fire menace, watchmen's service. He also states that the City of Toronto seems to be lacking in their authority to enforce the requirements of a proper inspection system and should without delay enact a by-law substantially as follows:—

Section 1. It shall be the duty of the Chief of the Fire Department to inspect, or cause to be inspected, all buildings, yards and alleys, as often as may be necessary, but not less than four times a year in the mercantile and manufacturing districts, and twice a year in other districts, for the purpose of ascertaining, and causing to be corrected, any conditions liable to cause fire, or any violation of any by-law affecting the fire hazard. Whenever said Chief or other duly authorized person shall find any buildings especially liable to fire by want of repair, or by reason of dilapidated condition, or defective chimneys, stoves, furnaces, etc., or by reason of any other cause, and when he or they shall find in any building, or upon any premises, dangerous combustible or explosive substances, or accumulations of rubbish, waste paper, empty boxes, or other inflammable material, especially liable to fire, or shall find obstructions to or on fire escapes, stairs, passage-ways, doors, etc., a record shall be made of such inspection, and the Chief of the Fire Department, the Deputy Chief, or the District Chiefs of the Fire Department shall order the aforesaid matters and things repaired, removed or remedied, within a reasonable time specified in said order.

Section 2. The Chief of the Fire Department shall keep a permanent record of all notices given pursuant to the power hereby conferred, and of all inspections and the results of such inspections, together with details of the measures taken to correct any defects or inadequacies so found.

Section 3. The Chief of the Fire Department, Deputy Chief, or District Chiefs, or the Police, or either or both of them, are authorized to enter at all reasonable times, upon any property in order to ascertain whether the provisions of the by-laws are obeyed, and to enforce and carry the same into effect.

Section 4. PENALTY. Every person found guilty of failure or neglect to comply with any of the provisions of this by-law, or with the requirements of any notice or order issued under the authority of this by-law, shall be liable upon summary conviction to a penalty of not less than five dollars ($5.00) nor more than fifty dollars ($50.00).

Section 5. All former by-laws or parts of by-laws inconsistent herewith are hereby repealed.

---

these conciliators, whose work is rarely heard of except locally. Then there is the National War Labor Board, of which former President William H. Taft is one of the two chairmen, which has jurisdiction over cases of particular importance and has been very successful. There are various other activities that have been helpful, particularly in encouraging men to work harder through motives of patriotism in these trying days.

It is beginning to dawn upon the trade that remarkable work has been done, and that labor supply for war industries and industries closely associated with the prosecution of war is not going to be nearly as scarce as would have been imagined considering the amount of industrial activity and the large number of men called into war service.

TRIED THE BONUS SYSTEM TO SECURE PRODUCTION IN MUNITIONS PLANT

Some of the firms in Toronto that are taking on contracts for big shells are doing the first few operations this week, and it will not be long before they have production up to their former standards on other lines of work. One question that is not yet fully settled is the extent to which women will be able to find employment in the shops doing the large calibre work.

"The question of handling the larger shell is going to take a little consideration," remarked the official of one of the plants this morning. "In our case we find that the gravity system that was quite capable of doing the other sizes is not going to handle the big shell satisfactorily. And speaking of handling," he continued, "it is one of the items that simply runs away with money all the time, and it is always a hard factor in overhead. There is about as much non-productive effort in the making of shells for this reason as in anything we have ever handled here. Try as you will it can't be cut very much lower than a good many of the shops have it now, but even yet it runs into a lot of money in the course of a month. Firms want to get production at the maximum figure, and they want to have the machines constantly going, and it all means that the material has to be brought to the machines in a constant supply, and of course that all means that more hands have to be engaged.

The Women Workers

"Our own experience," he continued, "has led us to the belief that we would like to employ women workers here. "When we were pressed for production some time ago we adopted a bonus scale in our shops. We paid the same money to men and women workers on piece work operations, and they worked under the same conditions. We made it a practice as well to give a $2 bonus every time a shop record was made or broken. We did not ask the worker to wait until pay day and have the amount added then, but went on the view that a bird in the hand is worth two in the bush. We would hang up the shop marks on certain operations. Well, the thing was a big success all the way through. As soon as a worker beat out a figure that had been previously high in the shop, an order was given on the pay office, and the bonus of $2 was handed over right away. It was interesting to watch who would get the most of these, men or women. It was our experience that three out of five times the record bonus was paid over to a woman. And as I said before, the men and women were working under exactly the same conditions, and were getting the same rate of pay for their work."

ANOTHER METROPOLITAN DAILY GOES UNDER DEPARTMENT STORE CONTROL

It will be remembered that Stewart Lyon, editor of *The Globe*, Toronto, and the editor of a Winnipeg daily, speaking at the annual meeting of the Canadian Press Association, lamented the fact that editors of the metropolitan daily newspapers had not a free hand. They were hampered by their big advertisers, the owners of departmental stores.

Rodman Wanamaker, of John Wanamaker & Co.'s big departmental store of Philadelphia and New York, who controls the Philadelphia *Press Record* and *North American*, has just been appointed by the will of the late James Gordon Bennett to the control of the New York *Herald* and the New York *Evening Telegram*. Although in control he has not been, nor will he be active personally in newspaper work. It is interesting to observe another big daily newspaper pass under departmental store control.

ECONOMY

That is the lesson we are slowly learning

Here is a machine—the Geometric Threading Machine—which has been economizing in screw thread production for a number of years. Busy automatic screw machines cannot profitably be slowed down to cut threads when there is a Geometric Threading Machine at hand. Especially since a Geometric Threading Machine costs one-tenth the price of automatics.

Geometric Threading Machines are employed on a large class of small threaded parts that cannot be produced economically on the ordinary screw machine.

Made in three sizes—to cut 1/8 to 1/2 inch, 1/4 to 3/4 inch, and 3/4 to 1 1/2 inch diameter threads. The carriage is mounted on slides, and on the largest size machine is moved back and forth by rack and pinion, and in the smaller sizes by hand.

Spindle speed changes readily made, adapting the machine to the diameter and material of the work. An adjustable stop assures accurate length of thread, and automatically opens the die head, permitting of drawing the work straight back.

A line from you brings full details regarding this machine. Tell us your threading requirements --- let us recommend the proper Geometric Collapsing Tap or Self-Opening Die.

This Aikenhead's "Toledo" on its First Job

Threading a 4-inch bend in position

Paid for Itself

In previous advertisements we've said Aikenhead's Toledo Tools earn their cost over and over. Here is a concrete instance: The four-inch bend photographed had to be threaded. Ordinarily that would have necessitated taking this whole pipe line down—a time consuming and expensive undertaking.

The engineer in charge was a stickler on costs—and in favor at the office in consequence. Furthermore, other work demanded his attention. So he readily calculated the expense of taking down the pipe line and threading the bend. He found it greater than the moderate price of an Aikenhead's Toledo Geared Adjustable Threading Tool No. 2.

Consequently he secured the Toledo Tool and made it pay for itself by threading this four-inch bend in position.

"And it has paid for itself a score of times since," was his own concluding statement.

We've an interesting Booklet for you if you

WHY

is the Automatic Wahlstrom Chuck favored by so many men responsible for output? Why is it the choice of plants that attain utmost output? And why is it so frequently selected when betterment of product is the objective?

The answer is in the following outstanding attributes—and in an indefinable something about the service of

Aikenhead's

Automatic Wahlstrom Chuck

that we call "satisfying" for the want of a better term: This Chuck enables the operator to make tool changes **in two seconds** without stopping the spindle of machine, because this Chuck automatically self-centres the tool. And because its jaws close on the entire shank in a never-slipping grip that becomes firmer as resistance on the tool increases, from the start to the finish of every operation it brings maximum accuracy and maximum speed. Indeed, an increase of 50 per cent. in output is not unusual.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

ENGINEERING

Ingersoll, Ont.—The Ingersoll Machine Co. is erecting two new buildings 80 ft. x 50 ft. and 50 ft. x 32 ft.

Port Arthur, Ont.—Actual construction work on the Nipegon Power Development at Cameron Falls was commenced on Monday, July 29. The first unit of development will be 30,000 horse-power and will be turned on in Port Arthur and Fort William by December, 1919.

Toronto, Ont.—A coal shed owned by the Connell Coal Company, situated on the Old Fort road south of Bathurst street bridge, has been destroyed by fire. The loss, as estimated by officials of the company, is in the neighborhood of $12,000, which includes the structure, a thousand-dollar motor and the coal elevating machinery.

Port Colborne, Ont.—The International Nickel Co. of Canada began to treat matte at the new refinery at Port Colborne recently. A large quantity of matte from the Copper Cliffe smelter has been shipped to the refinery, and supplies of all kinds are now on hand, and one furnace is in operation.

St. Thomas, Ont.—The new factory, formerly known as the Thomas Bros. Co., but now operating under the name of the Elgin Manufacturing Co., has already decided to install an up-to-date steam power plant in order that it may not find it necessary to close up. Up till the present time the only reason for this industry not being in full swing is the fact that it found it impossible to obtain the necessary power to do so.

MUNICIPAL

Newcastle, N.B.—Light & Water Commission, City Council, contemplate the erection of a $125,000 electric plant.

Coaticook, Que.—Tenders are being received by the secretary, M. R. Chartier, Coaticook, until August 1, for a $5,000 one-storey brick extension to power house.

Brussels, Ont.—A new cement water tank, 12 by 12 feet, for fire protection purposes, is to be built near the Ament factory, North Turnberry street. The council is asking for tenders.

Gladstone, Man.—The Town Council will erect an electric light plant at a cost of $15,000. The contract for meters has been awarded to the Canadian General Electric Co.; wire to the Phillips Electrical Works; transformers to the Ferranti Electric Co.

Goderich, Ont.—The by-law to grant exemption from taxes and other concessions to the National Shipbuilding Co. for ten years was carried by an overwhelming majority, the vote being 511 for the by-law and 47 against. The company will erect a new boiler shop, to employ at least 30 men, in addition to the plant they already have.

Toronto, Ont.—Bulk tenders for the following work, etc., in connection with alterations at main pumping station on John Street, will be received up to noon on Tuesday, August 6, 1918: (1) Plumbing and heating; (2) hydraulic plunger freight hoist. Plans and specifications may be seen and forms of tender and all information obtained at the office of the city architect, City Hall, Toronto.

Guelph, Ont.—With a view to the future, the waterworks commissioners are now considering the question of the installation of an auxiliary pumping engine, electrically driven. An electric pump with its installation and a 350-horse power motor may cost $16,000 or $18,000, and its use would enable the system to be run so that either electricity or steam-driven pumps could be used.

Vancouver, B.C.—Tenders for sprinkler system in sheds on government wharf, Vancouver, B.C., will be received until noon, on Thursday, August 15, 1918, for the installation of an automatic sprinkler system in the two wooden freight sheds on the government wharf at Vancouver, B.C. Plans and forms of contract can be seen and specifications and forms of tender obtained at the Department of Public Works, Ottawa, at the offices of the district engineers, Shaughnessy Building, Montreal; Equity Building, Toronto, and at the post office, Vancouver, B.C.

St. Thomas, Ont.—Unless some other means of obtaining the necessary energy is obtained, a number of St. Thomas industries will find it necessary to either close up their plants or install steam power in the fall of this year owing to the great shortage of Hydro-Electric power. It is said that at the present time, despite the order from the controller that no more industries, buildings or stores be supplied with hydro, there are still a number, on the plea of absolute necessity, who have been added to the already large list of users in the city, which means that when the order for cutting down on the amount of power used in this district comes, as it inevitably will, according to local hydro officials, these industrial concerns will either have to install steam or close up.

TRADE GOSSIP

The A. R. Williams Co., of Toronto, have purchased the Dominion Bronze Co.'s premises at Preston, Ont., which company has been in liquidation, and which has been indebted to the Town of Preston for some $10,000, being deferred annual payments and interest.

Lubricants for motors and cycles, etc.—A London manufacturer desires to appoint agents for the Western provinces for the sale of his products. (Address, British Trade Commissioner in Canada, 367 eBaver Hall Square, Montreal, referring to British Trade Inquiry No. 3019.)

Canadian inquiries for articles of British manufacture.—Canadian importers who may desire to obtain specific articles of United Kingdom manufacture are invited to communicate with the British Trade Commissioner, 367 Beaver Hall Square, Montreal, who will be pleased to obtain and furnish catalogues and price lists of the principal United Kingdom firms manufacturing the goods required.

M. C. Gilman, formerly sales agent for the Toronto Electric Light Company, has been appointed manager of the Montreal office of Willis L. Adams. He will handle the product of this firm in Canada, east of the C. P. R. line Kingston to Renfrew. The lines handled by Mr. Gilman will be the Packard transformers and meters, Thomson spot butt and seam welders, Willis L. Adams motors and arc welders, electric heaters of the Majestic Electric Supplies Co., and "Oil Gas" industrial furnaces.

New Montreal Firm.—The Union Engine and Machine Works, Ltd., has recently been organized to manufacture all kinds of general machinery and machine tool accessories. The company has acquired the ground floor of a three storey brick building with a floor space of about 8,500 sq. ft., at 344 Delorimier Avenue, Montreal. Installation of equipment was commenced about the first of June and actual operations were started about a month later. Those interested in the new Company are W. Chennery, H. Hill, Geo. Wheller and Chas. Moore.

Cars for U.S. Army Use are Standard-

"When we installed these Laco Lamps it was like moving into a new building!"

It proved conclusively, just as government statistics state—that men can do more work—do it better—with less effort—and more contentedly—when their shop is correctly lighted.

It removed all gloomy corners where dirt and idleness lurked — and replaced them with all-round, sanitary efficiency. It reduced the "sickroll" caused by eye-and-nerve-strain—lessened spoilage and accident hazard—so that straightaway effort was possible and increased production resulted. It actually added so much to the plant's capacity that it "seemed like moving into a new and larger building."

LACO NITRO LAMPS

replace old-time makeshift methods of lighting. They are designed to meet every manufacturing need in the matter of illumination. They are made in sizes from 60 to 1,000 watts. They are the modern development of the tungsten lamp—their tungsten filament burns at high temperature in rare inert gas and produces a close approach to actual daylight. Of course, there are other lamps supposed to be "the same."

Laco Lamps burn less current because they are more closely rated than other lamps—because they give more candle-power and less lamps need be used. Their average useful life is proved longer than any other make on the market.

It will pay you to consult a Laco Salesman to-day—he will tell you many other points that make LACO "The Lamp That Lightens Labor."

Canadian Laco-Philips Company, Limited

MONTREAL TORONTO WINNIPEG VANCOVER

ized.—Motor trucks and passenger cars for use in the United States army have been standardized, the War Department announced recently, and orders have been placed for 75,000 of all types. Four models of trucks, with carrying capacities ranging from one to five tons have been determined upon as best for army use. Two models are commercial types, but the other two have been developed by army engineers.

Spruce for Airplanes.—British Columbia spruce is urgently needed by the Imperial Munitions Board for the construction of airplanes, and a serious problem is being faced with regard to the securing of sufficient labor to maintain the output. It has been suggested that the formation of forestry battalions is the logical step to take in the solution of the difficulty. Its exponents have argued that the system that has met with such success in England might well be tried in Canada.

Prices of Coal Fixed at the N.S. Mines.—Announcement is made by C. A. Magrath, fuel controller, that the prices of coal at the Nova Scotia coal mines have now been adjusted. Before these prices were fixed the fuel control auditor made a careful audit of the books of the various coal companies and a detailed report of each case was submitted. The Fuel Controller also secured the services of some of the foremost mining men in the United States in order to have an independent, technical investigation made. Accompanied by Mr. Magrath these gentlemen recently concluded a personal survey of conditions in the Nova Scotia mining fields.

Maiden Trip of Concrete Boat.—The "Concretia" completed her trial trip from Montreal to Prescott, Ont., in just under twenty-four hours. The Concretia attained an average speed of 10 knots per hour on the run to Cornwall, the engines working perfectly, and the boat showing no vibration whatever. The Concretia was launched in the Montreal drydocks on Nov. 14, 1917, the construction being completed inside of eight weeks. She is 126 feet long, 22 feet six inches wide, with a depth of 12 feet 6 inches. The object of the trip was to give the Concretia a trial spin as far as Prescott, Ont., after which she will return to Montreal, when the work of completing the superstructure, which is as yet only temporary, will be finished. So far the officials on board express the utmost satisfaction with the carriage and behaviour of the new boat, and work on similar craft will now become a permanent industry in Canada.

Large Drydock in St. John.—Canada is to have the largest drydock on this side of the Atlantic, and one of the largest in the world. The St. John Drydock and Shipbuilding Co. has already secured the contract for its construction from the Department of Public Works, Ottawa. The contract calls for the construction of a drydock which will be of the first class and the largest on this side of the Atlantic, and will, when completed, be capable of accommodating the greatest ships of any navy in the world, or the largest mercantile vessels now built or contemplated. The length of the new dock will be 1,150 feet, and its width at the bottom 125 feet, with forty feet of water over the sill. The control of theh enterprise is in the hands of the Canada Dredging Co., of Midland, Ontario, a strong and wealthy corporation, which has acquired control of the stock of the St. John Drydock and Shipbuilding Co. The men who are associated in the new company are, according to the "Journal of Commerce," James Playfair, Midland, president and general manager of the Great Lakes Transportation Co, and president of the Midland Iron and Steel Co.; Hon. W. H. Richardson, Kingston; D. L. White, Jr., Midland; W. J. Sheppard, Waubaushene; W. E. Phin, Hamilton; D. S. Pratt, Midland; George Y. Chown, Kingston; R. Hobson, Hamilton; Col. Thomas A. Duff, Toronto; J. A. Paisley, Cleveland, and J. B. Craven, New York. The general manager of the company will probably be D. S. Pratt of Midland, Ont., who occupies a similar position at present with the Canadian Dredging Co.

PERSONAL

A. F. Chilcott has been appointed Montreal district manager of the Vanadium-Alloys Steel Co., Pittsburgh, Pa., manufacturers of "Red Cut Superior" high speed tool steel. Mr. Chilcott's offices will be at 512 Dominion Express Building.

W. E. Burris, a former Perth, Ont., boy, has been promoted to the position of manager of the Victoria, B.C., plant of the Foundation Company, which is building warships for the United States Navy. Their plant at Tacoma, Wash., is the largest shipbuilding plant in the United States.

GENERAL

Murrayville, Que.—Plans are being prepared for a warehouse for Brackman Ker Milling Co., Victoria. Manager, F. E. Corneille.

Outremont, Que.—The erection of a factory building is contemplated. Ernest Pitt & Co., 92 Notre Dame street E., Montreal, is interested.

Owen Sound, Ont.—The Booth Fishing Co. contemplate the enlarging of docks and the building of a freezing plant and warehouse. Local superintendent, Jno. McCauley, Wiarton, Ont.

East Broughton, Que.—A Canadian firm is opening a plant here for the manufacture of asbestos yarn, carded asbestos and sheet packings. Asbestos cloth, brake linings and packings will be manufactured when the necessary machinery can be obtained.

CONTRACTS

Fredericton, N.B.—J. H. Ward has the general contract for brick addition to foundry, for Smith Bros., Foundry Co., King street.

Paris, Ont.—Foundation Co., Montreal, have the general contract for dam and economizer house. T. Pringle & Son, Toronto, are the engineers.

Fort William, Ont.—The Canadian Westinghouse Co., Winnipeg, have the electrical contract for the erection of a $5,000 sub-station for the N. M. Patterson & Co.

Quebec, Que.—The Canada Iron Foundries, Ltd., of Redmil, Three Rivers, have the general contract for the construction of a water-main costing $7,000 for the city council.

Hamilton, Ont.—Thos Murphy, 241 Robert street, has the electrical contract for the erection of a $30,000 one-storey, brick, brass foundry, for Hamilton Brass Co., Burlington street E.

Hamilton, Ont.—Adam Clark, 7 Main street W., has the contract for the plumbing, heating and sprinklers for a four-storey, reinforced concrete, pattern storage building, for the Dominion Steel Foundry Co., Depew street.

Three Rivers, Que.—Laurin & Leitch Engineering and Construction Co., Montreal, Que., have the general contract for dredging the St. Maurice River for the Dominion Government, Department of Public Works.

Hamilton, Ont.—Leeks & Potts, 112 King street W., has the contract for the glass, and the Trussed Concrete Steel Co., Walkerville, Ont., has the contract for the steel sash for a $30,000, brick factory and office building for the Ford-Smith Machine Co., Earl street. The general contractor, W. H. Cooper, Clyde Bldg., will carry out the carpentry.

MARINE

Quebec.—The "War Gaspe," the third wooden vessel to leave the shipyards of Quinlan and Robertson, here, since last spring, was successfully launched July 27.

Ottawa, Ont.—The chief press censor announced recently that the steamer Siberian Prince, which went ashore at Lawrencetown, 15 miles east of Halifax, during a heavy fog, on July 2, has been floated and is now safely docked. The damage done was slight.

Sarnia, Ont.—Officials of the Northern Navigation Co. have received word that the steamer Huronic, which blew out a cylinder-head in Lake Superior, had reached Port Arthur and made repairs, and would leave on schedule time. The accident happened about 45 miles from Port Arthur.

Brockville, Ont.—The steam barge M. H. Wormington, which struck a rock near Sister Light, in the St. Lawrence River three weeks ago, has been refloated and taken to Montreal. Pontoons were used to raise the vessel, and much of her cargo of coal had to be lightered before the craft could be extricated. Her stern lay in 25 feet of water, while the bow rested on the shoal. Wrecking operations were conducted by the owners, the Vincennes-MacNaughton Co., Montreal.

Toronto.—Considerable significance is attached locally to the fact that the Dominion Shipbuilding Company has doubled its authorized capitalization. It is known that this company has been very busy since its establishment in Toronto, and it has already successfully completed several orders. With its new cash capital, it will now be in a position

BECKER

for

Milling Machines

The Becker is no Slacker

Like the volunteer who enlists at his country's call, the "Becker" Miller is ever ready to serve in the demand for bigger and speedier production.

They are setting the pace in milling operations in hundreds of plants. Let yours be the next to adopt them.

QUICK DELIVERIES—We are in a position to ship you the following sizes immediately: Nos. 1, 2, 2A, 2H, 3 and 4B.

The above smaller size Vertical Milling Machines are well adapted to a variety of work, such as light engraving, die sinking, profiling and milling small and medium size parts.

Becker for quick service. Write for further details.

The same firms—time after time

sending in copy for this section is one of the most convincing proofs of its worth to anyone with machinery or machine shop equipment to dispose of.

These firms know a good thing when they see it—they have learned by using this section just what it can do for them.

Try it yourself! That lathe, drill or whatever it is, describe it fully and send in your copy to-day for next week's issue. You'll find that the frequent use of this section will help you dispose of equipment you have outgrown—get what you want in a hurry, whether it be men or equipment.

Canadian Machinery
Classified Advertising Section

to further enlarge its plant and add new units and it is expected that output will be greatly increased within the near future. This is in line with strenuous efforts being made by other shipbuilding concerns throughout Canada, and the next four months is expected to see nearly a doubling of present capacity of Canadian shipbuilding plants.

London.—The first steel vessel built without rivets, so far as known, has just been launched on the south coast of England. The production of this vessel, it is considered, may mark an epoch in shipbuilding, the plates being fused together by electric welding in one process. General adaptation of this process, it is held, would speed up production, with an estimated saving of from 20 to 25 per cent. in both time and material. The United States Shipping Board, it is understood, has been in close touch with the experiment, with the result that arrangements are said to be in hand for the building of a number of 10,000-ton standard ships after this plan, in the production of which the riveters will become welders.

TENDERS

The equipment is the product of T. H. & J. Daniels, Ltd., of Stroud, England, and may be seen at the Home for Incurables, Portage la Prairie.

The equipment will be sold as it stands with all piping and accessories, and the purchaser must undertake the dismantling and removal of same.

The two units are inter-connected and engines are equipped with a complete brass pipe lubricating system, water cooling system, high tension magnets and compressed air tank for starting.

These engines have been used to operate direct current generators at the Home for Incurables, Portage la Prairie, Manitoba, for the past three years and are now rendered unnecessary by reason of the installation of alternating current motor to drive the generators.

Brampton, Ont.—Tenders, addressed to the Town Clerk will be received up to 6 p.m. Monday, August 5, 1918, for the reconstruction of the Brampton sewage disposal plant. Plans and specifications and other information may be obtained at the office of the town engineer, Brampton, W. M. Treadgold.

Montreal South, Que.—Date of receiving tenders for pumping station, equipment and filters has been extended to 6 p.m. August 1, 1918. Plans, specifications and particulars may be seen at the office of the undersigned, 66 Lafayette avenue, Montreal South, P.Q. E. Drinkwater, Municipal Engineer.

Sealed bids for the purchase of this equipment will be received up to noon of Monday, August 5, 1918, at the office of the undersigned. Full detailed description of the plant and permit to inspect same may be had on application to S. C. Oxton, Deputy Minister of Public Works, Winnipeg, Man.

Toronto, Ont.—Tenders will be received until Tuesday, July 30, 1918, for metal ceilings, Alexander Muir School, electric wiring, caretaker's cottage, Strathcona School, compressed air boiler tube cleaner, High School of Commerce. Specifications may be seen and all information obtained at the office of the Superintendent of Buildings, 155 College Street.

St. Thomas, Ont.—Tenders for construction of reinforced concrete culvert and steel bridge in the Tuscarora Indian Reserve, counties of Brant and Haldimand, Ont., will be received up to August 4, 1918. Plans and specifications may be seen at the post office at St. Thomas, Ont., also at the office of the Indian agent at Hagersville, Brantford, and upon application to the Department at Ottawa.

Winnipeg, Man.—The Department of Public Works has for sale two complete units, each consisting of the following:

One wrought iron gas generator, 3 feet 2 inches in diameter by 5 feet high with scrubber, washers, expansion chamber, air intake and cleaner, and all connected to a one-cylinder four-cycle hit and miss horizontal type 60 h.p. suction gas engine, diameter of piston 15½ inches, stroke 23 inches, flywheel 7 feet 6 inches diameter, 15-inch face.

Ottawa, Ont.—Tenders will be received until noon, August 2, 1918, for the coal and ash handling equipment required in the construction of the central heating plant of the Parliament Building. All tenders to be based on the supplying, execution, installation and completion; together with the furnishing of all material, tools, appliances, labor, etc., necessary and described by the plans and specifications for the coal and ash handling equipment. Plans, specifications, and any other information required can be obtained at the office of the general contractors, P. Lyall & Sons Construction Co., Ottawa.

Ottawa, Ont.—Tenders will be received until noon, August 8, 1918, for the hydraulic elevator equipment required in the construction of the central heating plant of the Parliament Building. All tenders to be based on the supplying, erection, installation and completion; together with the furnishing of all material, tools, appliances, labor, etc., necessary and described by the plans and specifications for the hydraulic elevator equipment. Plans and specifications, and any other information required can be obtained at the office of the general contractors, P. Lyall & Sons Construction Co., Ottawa.

and dollars, and head office will be in the citp of Montreal.

Incorporation has been granted in Ottawa to the Windsor Ferry Co. Ltd. The incorporators being O. E. Fleming, A. B. Drake and A. H. Foster, M. Allworth and J. A. Young. Their business will be to construct, purchase or acquire boats, vessels, etc. The capital is placed at five hundred thousand dollars, and the head office wil be at Windsor.

Notice appears in the official Gazette at Ottawa, that Motor Trucks Ltd., of Brantford, has been empowered to increase its capital stock from the sum of five hundred thousand dolars to the sum of one million dollars, each to consist of five thousand shares of $100 each. This company has very extensive contracts in the manufacturing of munitions in the city of Brantford, at the present time.

Incorporation has been granted at Ottawa to the Beaver Engineering Co., Ltd., the incorporators being C. M. Worthington, H. G. Stewart, P. Ranger, S. Epstein and L. Gosselin. Their business will be to manufacture and deal in steel, iron metals, minerals, chemicals, etc. The capital will be one hundred thousand dollars and head office will be in Montreal.

Incorporation has been granted in Ottawa to the Ideal Fence & Spring Company of Canada, the incorporators being B. M. McGregor, W. D. McGregor, W. A. Leitch, S. W. Prentice, W. H. Burnham. They will deal in and make wire goods, woven wire fencing, and merchandise, etc. The capital is placed at three hundred thousand dollars and the head office will be at Windsor.

Incorporation has been granted at Ottawa. to the Standard Shipping Co., Ltd. The incorporators being F. H. Markey, W. W. Skinner, G. G. Hyde, R. C. Grant and C. M. Ballinger, of Montreal. Their business will be to carry on the work of transportation of passengers, mails, freight, etc, and to manufacture, purchase or deal in steamships, barges, etc. The capital stock is placed at one million dollars and head office will be in Montreal.

Dominion Incorporation has been granted to the Steam Navigation Co. of Canada, Ltd. The incorporators are C. A. Sara, F. H. Markey, R. C. Grant, F. J. McGarigle and C. M. Greeves. The business will be to carry on the transportation of passengers, mails, freight, etc., and to build steamships, steamboats, barges, etc. The capitalization is placed at two million, five hundred thousand dollars, and the head office is in the city of Montreal.

MARCH BEFORE STATION OPENS

The first of March, 1919, is the day set for the new Toronto Union station to reach completion, and if the city is agreeable it will then be opened onto the level tracks, as it would be three or four years before the proposed plans of constructing a viaduct so that passengers could board trains from overhead sidewalks instead of having to cross the tracks, could be completed. J. R. Ambrose, chief en-

gineer of the Toronto Terminal Railway Company, said the labor question was a problem at the present time as they had only 250 men on their construction staff, while there were openings for probably 400. They are just commencing the installation of the water system, the plumbing and the wiring of the building. When this is finished then the partitions will be constructed.

COPPER SUBSTITUTE HAS BEEN FOUND NOW

Stockholm, Sweden.—The State announces successful results from comprehensive tests of a substitute for copper in carrying electric currents, including telegraphic and telephonic messages. The discovery, reports of which have come from Germany for some time past, is likely to have far-reaching effects on the copper market.

The method consists in intertwining iron and zinc wires in various ratios according to the distance the current must be carried. No copper is involved.

It is likely that the discovery will soon be utilized to a considerable extent in Scandinavia, where the copper shortage is causing serious inconvenience.

TOO MUCH FOR THE LAWYER

A young foreigner was being tried in court, says "The Public Ledger," and the questioning by the lawyers on the opposite side began.

"Now, Laszky, what do you do?"

"Ven?" asked Laszky.

"When you work, of course," said the lawyer.

"Vy, vork—"

"I know," said the lawyer, "but what at?"

"At a bench."

"Oh," groaned the lawyer. "Where do you work at a bench?"

"In a factory."

"What kind of a factory?"

"Brick."

"You make bricks?"

"No, de factory is made uv bricks."

"Now, Laszky, listen," said the lawyer. "What do you make in that factory?"

"Eight dollars a veek."

"No, no! What does the factory make?"

"I dunno; a lot of money, I think."

"Now, listen! What kind of goods does the factory produce?"

"Oh," said Lasky, "good goods."

"I know, but what kind of good goods?"

"The best."

"The best of what?"

"The best there is."

"Of what?"

"Of dose goods."

"Your Honor," said the lawyer, "I give up."

Casey—"It's the iligant time Oi had lasht Saturday. Divil a thing can I remember afther 4 o'clock."

O'Brien—"Thin how d'ye know ye had a good toime?"

Casey—"Sure, didn't Oi hear th' cop tellin' the joodge about it on Monday morning."—Transcript.

The Postal Strike Ward Politics and War.

WHEN postmen strike what happens? You know. Every home, every business concern instantly suffers handicap. There is immediate money loss to many. Instant remedy of the situation is called for. Government interference is suggested by aggravated citizens to mend Government mismanagement, and sympathies of the many are with the mail employees. Having seen it happen you will be keenly interested in the clear, critical, incisive editorial which appears in THE FINANCIAL POST of July 27th, and deals trenchantly with the cause of the whole aggravating occurrence. The article is by Col. J. B. Maclean. That is good guarantee that it is written straight from the shoulder, and that without wasting one word it will give you facts you cannot well afford to miss. Get THE POST this week and read this.

Keeping Borden in London

In his article on the Postal Strike Col. Maclean refers to the evil of ward politics in connection with National Affairs. On a still more important scale in THE POST of July 27th he deals with Sir Robert Borden's mission in London, and points the peril of letting petty political views interfere with the vitally necessary work of the Premier in Great Britain. This article also will keenly interest you, and you will find after reading it that your war news will mean so much more to you that you will be downright glad you got hold of THE FINANCIAL POST OF CANADA — the searchlight on news values.

Other Contents of The Post are:

July Full Moon Brings Frost to the Prairies
Conditions on the Pacific Coast Are Favorable.
Another Hydro-Electric Scandal.
Forgings, Car, and Maple Leaf Led on Exchange.
Abundant Growth Around Edmonton—Business Normal.
Real Estate Values in Western Cities.
Remarkable Claim Made by a Mining Company.
Effect of Power Control in the United States.
Vancouver Electrical Workers Act Arbitrarily.
How Exports of War Supplies Have Expanded.
Bank Clearings Again Fall Off in the West.
Merchants Bank Not Increasing Capital Stock.
Adapting Card Index System in Bank.
Bonus Share Schemes are More Numerous.
A Thousand Concrete Houses for Halifax.
Dealers Advocate Taxable Victory Bonds.
Financial Affairs of Prince Albert, Sask.
Edison as Employer of His Own Son—by His Son.

The Western articles in this contents list are full of first hand news of the exact conditions of crop and business secured by such experts as Miss E. Cora Hind, and J. W. Tyson, Editor of THE FINANCIAL POST, who is making a special tour of the West to ensure accurate information and the business point of view clear and unbiased on all Western affairs this Fall, and their effects on Canadian business conditions. You will find it profitable to avail yourself of POST service from now on. Send for a subscription ($3.00 per year) using the form here given:

The Maclean Publishing Company,
153 University Ave., Toronto.

Send me THE FINANCIAL POST OF CANADA regularly till further ordered. I enclose—will send—subscription price, $3.00 per year, on receipt of bill, or you may draw on me for this.

Form the habit of using this section

When you want to buy or sell new or used equipment, use this section.

If you need machinery in a hurry, here is where you will find the names of firms equipped to supply your needs. And if you have old machinery which has outgrown its usefulness to you, tell Canadian Machinery readers about it in these pages.

That the same firms advertise here week after week is pretty good evidence that they are getting business. That you have looked over these ads. for equipment is evidence that others will do the same thing.

Get the habit of looking over this section every week. The bargains you will pick up by being first on the job will pay you for the time you spend each week.

PUNCH PRESS WORK

What Can You Save?

By Using Parts Made in the Punch Press

Look over your standard parts, Mr. Manufacturer, and see what parts can be made (or could be made by slight change in design) by this process.

You will be surprised at the saving you can effect.

We make Blanking, Perforating, Drawing, Forming and all classes of dies and tools for plain or difficult stamping to suit the production required.

A Battery of presses is also available at our plant to manufacture parts for you with the understanding that you pay only for good parts made. Our facilities ensure prompt deliveries at right prices.

"MARITIME"

9.2 Heavy Duty Single Tool Shell Boring Lathe

SPECIFICATION

Width of Bed	20 in.	Rear Bearing	6x5¾ in.
Length of Bed	10 ft.	Driving Pulley	48x8 in.
Length of Carriage on Bed	32 in.	Lead Screw, Diameter	2½ in.
Diameter of Boring Bar	5½ in.	½-inch Pitch, Acme Thread, with Half Nuts	8 in.
Front Bearing	16x6¾ in.		

Long Double Roller, Profile Cam, fitted with Two Steel Rollers 3½ in. diameter. Fitted with Manufacturers Equipment Co. Air Collet.

Note.—Shell is Chucked in Head of Lathe, insuring rigidity, and shortening length of bed to allow minimum floor space.

Profile Boring Bar made to ample dimensions, with single tool, in place of using expensive series of rough and finish Spade Cutters.

Lead Screw is extra large, with Extra Length of Half Nuts, insuring long life of lead screw and nuts, as having a greater wearing surface.

The above Tool is suitable for boring 9.5 in. shells, and would give excellent satisfaction in boring 6 in. and 155 mm., or 8 in. and 220 mm. H. E. Shells.

This machine is driven direct from Clutch Pulley on Line Shaft. We do not supply Clutch Pulley or Countershaft, if same is used.

Manufactured by T. McAVITY & SONS, LTD., ST. JOHN, N.B.

The 'ALL-ANGLE' GRINDER

The Most Universal of Them All

Made by Toronto Type Foundry Company, Limited, Toronto, Canada

The All-Angle Grinder

What are the Essential Requirements of a Tool-room Grinder?

Here they are:

1st Accuracy — The "All-Angle" Grinder is tested to that highest degree found only in machines of the first order.

2nd Speed — We speak conservatively when we say that most jobs can be set and ground in one-half the time consumed by other makes. Instal the "All-Angle" Grinder and keep your milling machines from standing idle waiting for cutters to be ground.

3rd Universal — We do not know of any combination of three tool-room grinders now on the market that has the range of work possible on the "All-Angle."

The photographs opposite show the following operations:

GRINDING

1—Teeth of a Degree Cutter.
2—A Lathe Arbor.
3—Side of an Inserted Tooth Milling Cutter.
4—A Limit "C" Gauge.
5—The Teeth of a Spiral Milling Cutter.
6—One side of a hardened Steel Profile Gauge.

GRINDING

7—A Blanking Die with Cup Wheel.
8—Teeth of a Spiral Reamer.
9—Hole in a Milling Cutter.
10—Periphery of an Inserted Tooth Milling Cutter.
11—A 4.5 H.E. Shell Nosing Die.
12—A Six-inch Ring Gauge.
13—A Blanking Die with one degree taper.

REPRESENTATIVES DESIRED IN OTHER COUNTRIES

A Convenience—*that brings*—Economy

The Bowser System can be added to whenever more storage capacity is required. It is convenient, economical and fire-proof. Write for illustrated bulletin—to-day.

ECONOMY is the great thing to-day. It applies to every necessity; in the shop to time, labor and materials — it means quicker and greater production with less effort and cost. Production is increased when machines are lubricated properly; upkeep and labor is reduced and time saved.

Oil, therefore, is a necessity that should be protected by modern storage and handling facilities so that waste, careless handling, evaporation and deterioration of oil will be stopped, and the danger of interruption to production by fire, removed.

Ideal provision for the economical Storage and Distribution of Oil is embodied in the

BOWSER ESTABLISHED 1885

Oil Storage System

It is designed and built for any oil storage or distributing requirement, large or small, hand or power operated. It is durable, accurate and safe; promotes efficiency, suggests cleanliness, lightens labor, and saves oil and money.

Every Shop Needs It.

S. F. Bowser & Co., Inc. TORONTO, ONTARIO, CANADA

ILLINOIS TOOL WORKS
CHICAGO, U.S.A.

"DAVIDSON-IZED"

HIGH SPEED STEEL FORM TOOLS

"Davidsonized" Steel means a process of intensifying and making the molecular structure more homogeneously continuous, obtaining results from the various alloys heretofore believed impossible, hence the steel becomes decidedly tougher, with approximately 50% greater resistance to abrasive wear. **Consequently** the cutting efficiency has been increased quite 50%, as tests have proven.

We supply "Davidsonized" High Speed Form Tools in rough annealed state ready to be ground to accurate size and hardened, thereby **eliminating** 50% of toolmakers' time, which constitutes a net saving to the user. **Moreover,** our tools give insurance against loss of labor through breakages in **hardening.**

The use of these tools will save thousands of dollars to munition makers in Canada.

RESULTS:

Lower tool costs
Less tool expense
Less machining
Less grinding
Guaranteed against breakage in hardening process
Greater quantity production

Send drawings, blue prints or patterns and we will quote prices and speedy delivery.

HERE is an example of forced output on a battery of 40 Warner & Swasey No. 6 Screw Machines. (This picture shows one of them) machining detonators—one every $2\frac{1}{2}$ minutes, and the battery in operation day and night. The stock is $1\frac{7}{8}''$, is drilled 15-16″ for a depth of 3 15-16″, turned all over, and cut off, ready for the second operation.

Best for Detonators

Piece work is considered best by a great many manufacturers on straight run work of this sort, especially when under penalties for delivery delays. And only the best machines can hold their accuracy under such continuous operation.

For unusual demands such as this, and for absolute certainty in making delivery promises, specify Warner & Swasey Turret Lathes and Screw Machines.

OXY-ACETYLENE WELDING & CUTTING

CONSERVING MATERIAL—INCREASING EFFICIENCY

3,500-lb. Hydraulic Shell Press reclaimed by Oxy-Acetylene Welding

The necessity for conserving material and of keeping machinery and equipment up to a 100 per cent. standard of efficiency has rendered an Oxy-Acetylene Welding Outfit an invaluable acquisition to practically every industrial plant.

Whenever two pieces of metal have to be permanently joined, Oxy-Acetylene welding has become the standard method of performing the work. By this means hundreds of manufacturing and repair problems have been solved with a saving in cost, time, labor and material, and in many ways the process is doing much to relieve the situation brought about bv the present shortage of metals and labor.

We are at your service for all information required

"In our opinion the Landis Machine is far superior to any similar machine that we know of on the market to-day."

Mr. Thos. Hoops, general manager of Wilcox, Crittenden & Co., Middletown, Conn., knows what he is talking about. He used other makes of threading machines but it took the Landis to bring forth the above statement.

Landis Die Heads and Machines can't help but be superior to other makes. It's the chaser which is responsible, and its design includes **exceptionally long life—variable rake angle—line contact between chaser and stock—interchangeability of chasers,** one may be replaced without renewing the entire die—**absence of annealing, hobbing and retempering,** a slight grinding renews the chaser.

You, too, will find the Landis superior. Send us your complete threading specifications. Our Engineering Department is at your command.

You Should Know These Facts About ARMCO Welding Rods

Better welding rods than ARMCO never were made and are *NOT* going to be—simply because the highest grades of (so called) Norway and Swedish Iron are no more uniform than ARMCO Iron.

Before putting ARMCO Rods on the market, the metallurgists and specialists of the American Rolling Mill Company concentrated years of profound study upon welding requirements. Together at the furnace, at the microscope, in actual applications, and in ways that had never been attempted before, these engineers developed a metal peculiarly free from slag, sulphur, oxides, phosphorus and other impurities harmful to a uniformly strong, efficient weld. Further, under their able direction, this filling material has been standardized in two grades, one for oxy-acetylene and another for electric welding, both of which do **well**, what has heretofore required a choice of one from many grades. ARMCO Rods are therefore the logical material for successful welders who seek to protect alike their own reputation and their customers' or employers' best interests.

ARMCO Rods stand the test of the man who must be shown, and to those who can grasp the opportunities of an expanded welding field will be found one of the best investments that any welding shop can make.

AMERICAN ARMCO INGOT IRON

The trade mark ARMCO carries the assurance that iron bearing that mark is manufactured by the American Rolling Mill Company with the skill, intelligence and fidelity associated with its products, and hence can be depended upon to possess in the highest degree the merit claimed for it.

If you want to know just what ARMCO Rods will do under specific conditions, and where ARMCO Rods are meeting like requirements with absolute satisfaction, tell us about your present methods. Our engineers will gladly advise you if improvement is possible and to what extent.

The Mulliner Quick Change Lathe

Every part of this lathe bears the "ear marks" of expert workmanship—and the excellent construction shows that we have made a close study of present day shop demands.

The Mulliner will give you a production that will surprise and please you.

Guaranteed to bore and to turn true to within .001 inch if properly set up. There are as many as 37 different threads and feeds; every Tool Room Attachment.

Self-Adjusting front and rear journals are adjustable, independent of each other, and the headstock spindle is special carbon hammered crucible steel. Rigid head of pan construction makes backward deflection of front bearing quite impossible.

The ring self-oiling system is another MULLINER feature.

Will be pleased to send full details and catalog.

Write to-day if interested.

Mulliner-Enlund Tool Co., Inc., Syracuse, N.Y.

The PHOTOSTAT—A Thrift

TRADE MARK REGISTERED

The American Blower Company, Detroit, says:

"We originally installed the PHOTOSTAT to copy blue prints or tracings of old jobs after slight changes and save making drawings on duplicate equipment.

"Now we use it also to furnish engineering data sheets to our 50 sales engineers—increasing their sales as a result.

"We reproduce blue prints sent in for quotation and in cases where tracings are lost, to avoid the making of new tracings. We copy all important contracts to use duplicates and prevent losses, which occasionally happened before.

"We can see such large savings that the actual figures will stagger us—for a boy copies in a few minutes what would take a draftsman half a day—saving about 95% in cost—to say nothing of the advantage of quicker service.

"Good draftsmen are in demand and hard to get, so that using a machine for copying work is both economical and patriotic."

The Photostat, which is manufactured by the Eastman Kodak Co., is a combined camera and copying machine. The copy is made directly onto a roll of paper. No intermediate glass plate or film or other negative has to be made. By copying thus directly onto the paper, the copy is made very quickly and at a low cost. Also the copy is a facsimile of the original, so that there can be no mistake in it. The print is developed and fixed right in the apparatus itself; this part of the process, as well as the focusing and exposing, all being mechanical. The print is then removed to a tank of running water, in which it is washed free from chemicals. Finally the print is taken from the water and dried and is then ready for use. The whole process is a rapid one, the average speed per print being from one to five minutes.

The PHOTOSTAT is used to copy at actual size, in reduction, or in enlargement.

In **Banks** and **Offices:** Reports, Cost Sheets, Vouchers, Accountings, Wills, Contracts, Testimonial Letters, Pages from Books;

In **Factories** and **Machine Shops:** Blue Prints, Shop Orders, Sketches, Pencil Drawings, Tracings, Illustrations for Salesmen, Cuts and Drawings for Patent Work;

By **Public Service Corporations:** Reports for Directors, Insurance Papers, Tariffs, Way Bills, Claims, Traffic Reports, Conductors' Sheets, and Certified Copies of Records.

Wright

High Speed Steel Hoists

In Wright Steel Hoists, the Driving Shaft and Pinion are made from nickel carbon steel forging. The Load Chain Wheel is a crucible steel casting and the Bearings are hard malleable iron. Both Load Wheel and Bearings are guaranteed not to break. The Load Chain is the best that can be made; it will carry loads of from three to four times the capacity of the hoist. The Hook will carry loads five to six times greater than the capacity of the hoist without bending; it will straighten out before breaking.

Wright Steel Hoists will outlift and outlast any other hoist on the market to-day. Made in sizes up to 20-ton capacity.

May we send you our new Catalog for your files? Write us now.

Never Break

Never Foul

Wright Mfg. Company, Lisbon, Ohio

If you use chain-blocks in your business you should have a copy of booklet 67: it slips into your pocket comfortably but contains, in condensed form, a wealth of useful information on hoists. Tell your stenographer to write for a copy to The Herbert Morris Crane & Hoist Company Limited, Niagara Falls, Ont.

FORTIERVILLE, - - QUEBEC

On Harder Drives

ALMOST daily we hear from some customer whose hardest belting problem has been solved by Extra Power. As the following letters show, the harder the drive the more enthusiastic is the Extra Power user.

Nor can its utility as a general service belt be overlooked. Wide experience has proved its efficiency and economy on *every* drive. The same qualities that make it the solution of difficult transmission problems make it better also on ordinary drives.

Its non-stretching, pulley-gripping, flexible qualities—bringing increased production, fewer delays and shut-downs, saving of power and coal—warrant a further acquaintance on your part.

'Phone or write the nearest Goodyear branch. A trained belting expert will call at any time—without obligation, of course.

Saved Money in Flour Mill Equipment

SWAN RIVER MILLING CO.,
Swan River, Man.

A year ago, on the 15th of October, I started my flour mill running, fully equipped with Extra Power belting on all drives, from the smallest to the largest, and to date have had no trouble of any kind. All my belts are in first-class shape and show very little sign of wear.

Your Extra Power belting grips the pulleys and I have not had trouble from slipping, consequently I am getting the full value of my power plant. There has been so little stretch to these belts that it is not worth mentioning and I am entirely satisfied with the work they have done and can highly recommend them for any kind of work. In equipping my mill with Extra Power I saved approximately $500.00, as I had intended to use leather belting, as I wanted the best belting to be had, and I am satisfied that I got it.

I have been using different kinds of belting for the last twenty years, but Extra Power is the best I have had yet. A. B. REA.

A Record in this Sugar Mill

Mr. F. W. Gonyan, Chief Engineer of the Dominion Sugar Company, states regarding an Extra Power belt in their Wallaceburg plant:

"46 ft. 4 in. of 7 in. x 8 ply Extra Power on Screw Conveyor Drive. Load Variable. Belt always exposed to live steam. A special canvas wouldn't start the drive; another type of canvas belting lasted one week; leather unsatisfactory; Extra Power has run one year and has never been touched."

In a Very Dusty Place

"The 14-inch 6-ply Extra Power belt purchased from you over a year ago has been running continuously at a speed of 4,300 feet per minute, transmitting 75 H.P. Very little stretch developed and the belt is practically as good as new. It was operated in a very dusty place."

Chapman

Double Ball Bearings

CONSERVE POWER! There is too much power going to waste the world over. This fact has been noted by the British Government and sweeping reforms are contemplated in Great Britain.

Canada also wastes much power. A reform is necessary here, too. Babbitt bearings are being used too often where **Chapman Double Ball Bearings** should prevail. The adoption of Chapman Double Ball Bearings, wherever an axle or shafting needs support in the transmission of power, results in a saving of 75% of friction loss.

Now in use in over 2,000 Canadian factories. Fit any adjustable hanger. Adopted by Canadian and United States Governments.

Write for full story of their efficiency.

"You Will Yet Be Glad"

PRIVATE PEAT, who has sprung into fame through his books and extensive platform work, contributes an article to the August issue of MACLEAN'S MAGAZINE under the above heading. It is a cheery, optimistic message, contrasting conditions in 1914 with things as they are to-day. Private Peat, always a "headliner," is at his best in this article. But

Private Peat is only One of Many Features

In August MACLEAN'S there are half a dozen other writers with just as much "pull." Glance at this list:

"The Strange Adventure of the Man from Medicine Hat," a striking mystery story. By *Arthur Stringer*

"The Three Sapphires," a splendid serial story. By *W. A. Fraser*

"Keeping Borden in London," a fearless summary. By *Lt.-Col. John Bayne Maclean.*

"The Enemy Under the Earth," an article on the most terrifying phase of modern warfare—sapping warfare under the earth. By *Lt. C. W. Tilbrook.*

"Uplifting the Press," a satire on certain activities of the Dominion Government. By *One of the Uplifted.*

MACLEAN'S presents the vital and interesting things dealing with Canada—the most fearless criticism, the most entertaining comment, the biggest exclusive stories. Contributors to MACLEAN'S are the best writers and the most interesting personalities that the Dominion has produced. It is brimful of "features."

TOOLS

FILING IS LIKE SHAVING

When your razor is sharp you enjoy the shave. When it is dull it tries your temper.

Don't expect workmen to give you good results with half-worn files. You merely irritate them.

Tell them to turn in files when they have passed their "efficient" point, and you will get better jobs and have contented mechanics.

"Famous Five" files stay hard and sharp because they are accurately cut and properly hardened. Specify them when ordering.

Peerless HIGH SPEED

A New Standard in Metal Cutting Increases Production 50% to 100%. Saves in Time, Labor and Material.

Take the older standard saws, some of which have been deservedly regarded as excellent machines, and add 50 to 100 per cent. to their output, and you will come pretty close to the productiveness of the Peerless High Speed. It has created a NEW standard of production, which is all its own.

Repeat orders tell the story. Some of them come from manufacturers who have had to wait for Peerless machines when they could get others at once, paying heavy express charges to get them quickly.

The Peerless High-Speed saves in time, labor, blades and material. It cuts faster, with a thinner blade, with less attendance and with a smaller consumption of saw blades than any other metal saw made.

Order a "Peerless" on 30 days' trial. We pay freight BOTH WAYS if it fails to make good.

CUT YOUR CUTTING COST WITH VICTOR Flexibles

The high cost of tools should emphasize more than ever the importance of quality.

The high cost of hack saw blades ought to drive every hand blade user over to the saw that does not break in ordinary hand work.

VICTOR FLEXIBLE HACK SAW BLADES have exactly the same cutting power as the finest All-Hard on the market, and that they cannot be broken in use except by intentional abuse is an undisputable fact—which will represent a saving from twenty-five percent to thirty-three and one-third percent in breakage alone.

Seventy-five percent of the All-Hard blades used in hand frames break before they are worn out. Watch the All-Hard blades in your own shop and see the enormous amount of breakage—then use VICTOR FLEXIBLES and note the economy.

Spring and Varick Streets (*Visitors Welcome*) 50 Years New York City

Rockford Horizontal Boring Machine

For Automobile Manufacture

This tool is unusually rapid and accurate in the boring of crank cases, transmission cases and rear axles. Has two heads at right angles to each other. Spindles bore longitudinal and cross holes in work simultaneously.

Send us blue prints of your boring work and we will give you figures on the "Rockford's" ability on it.

The Rockford Drilling Machine Co., Rockford, Ill.

MODERN

"MODERN" Self-Contained Plain Grinding Machine

These "Modern" Tools solve the problem of reducing cost and increasing production.

Built in a wide range of sizes and include Plain, Universal and Internal Types.

The "MODERN" 12-inch x 48-inch Self-contained Grinding Machine is finely adapted to meet the present demand for large production. It minimizes labor and gives a maximum output of highly finished parts.

The "MODERN" Die Chaser Grinder

Does away with a lot of die trouble, because its output is marvelously eccentric.

Made for belt drive or a complete motor-driven unit. Special attachments for grinding Spring Dies, Pipe Dies, Reamers, Taps, Hobs, Spiral and End Mills, Milling Cutters, etc.; can be furnished with the regular equipment.

Bulletin C.G. will give you full details.

We'll be pleased to send information on the complete "MODERN" Line.

WE ARE ENLARGING OUR PLANT

Hull Iron & Steel Foundries, Limited

"HISCO" will shortly have an increased capacity which will make it the largest foundry of its kind in Canada.
Two big new electric furnaces are being added to our present large equipment. And cleaning and annealing department measuring 300′ x 100′ is about to be completed.
This will place us in a position to handle orders big and small with unequalled facility.

We make steel, Chrome, Manganese and Nickel Steel Castings—annealed and unannealed.
Cement Mill and Mining Machinery Castings; Stamp Mills, Crushing Plants, and Excavating Outfits.
Steel Car Wheels, Locomotive Driving Wheels and Frames, and all Castings for car builders and locomotives.
GEARS—Machine moulded, any size up to 18 feet without patterns.

Hull Iron & Steel Foundries, Limited, Hull, Que.

After the War——What?

The time to put on fire insurance is before the fire. The time to prepare for after-the-war conditions is before peace comes.

If any advertisement interests you, tear it out now and place with letters to be answered.

Interchangeability of Face Mills

Twenty-two different Cincinnati Millers now have a flanged spindle end, and can use the same face mills. That means great economy, because it is no longer necessary to keep on hand face mills to fit each machine.

It saves time and trouble, because every man who has used a face mill knows how hard it is to get it off the spindle after a heavy cut. That is because of the threaded end. We have done away with that entirely, by abolishing the threaded end.

The flanged ends have hardened keys, and the driving is done entirely through these keys. It is easy to remove cutters after the heaviest service.

These same hardened keys also now drive our larger cutter arbors.

This is only one of the many features that have enabled CINCINNATI MILLERS to gain supremacy.

The Cincinnati Milling Machine Company

The Hall Special, High Speed, Heavy Duty, Single Purpose Lathe

Our new six-inch special single purpose lathe is the last word in machine design and the height of efficiency. It has been designed to meet all the requirements for fast production under war conditions, and at the same time reduce to a minimum the cost of repairs and eliminate lost time in break-downs.

The bed is of the box type, headstock, bearings and cross slide being cast integral, making a very solid and compact arrangement. The main spindle bearings are self-oiling, while all driving gears are of steel and run in a bath of oil. Main spindle and cross feed screw are equipped with SKF ball thrust collars. The machine is equipped with air chuck, pump and wrench. No countershaft is required. The machine shown is tooled for facing the base end of 155-mm. or 6-inch shells. Can also be tooled for Recessing Base, Rough Drill and Bore Nose, or any other operation or special work for which a machine of this type can be adapted.
Other sizes and types for the different size shells.

MILLING MACHINES

FOR

Rapid Production of Motor Parts

The **demand** for increased production **requires tools** of **great strength** and **durability**; the Fox 2-A Universal Milling Machine illustrated has met this demand, and is being used wherever extreme accuracy and quantity production are required.

The machine has a universal table, spiral cutting attachment, 10″ Dividing Head with 6″ Universal Chuck, making it a machine **especially adapted for Tool Room Work.**

The **United States Government** is using this machine in its various **repair shops** for **Aeroplane Motors.**

You should be using this tool to help the production of parts necessary for the prosecution of the war.

Specifications — No. 2-A Miller.

Spindle speeds 12
From 21 to 423 r.p.m.

Table feeds 6
From .317″ to 2.79″ per min.

Table .....8½ x 27″
Long. feed (power) 26″.
Vertical feed (hand) 13″.
Trans. feed (hand) 8½″.

Drive .....Single pulley 10 x 3″ running 250 r.p.m.

Gears —..Hardened steel
Weight .....1,500 lb.

We build this same machine with a plain table, omitting the spiral cutting attachment and Dividing Head.

Our No. 1 type machine has a four-step cone drive, and while being a lighter machine is a "bear" for work. This is **proven by** the **hundreds** of **them in** the **largest munitions plants.**

We also build the Fox Multiple Spindle Drilling Machines.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000, in General Use

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Modest Prices

Grand Rapids Grinder No. 2 brings to your grinding jobs all the ability of a truly universal machine. It is constructed with greatest care and equipped with genuine crucible steel spindles, ground and running in ring-oiled bronze bearings. Its low price is accounted for by the efficiency of our own plant. **Write to-day for bulletin.**

Grand Rapids Grinding Machine Co.

18 Ottawa Ave., N. W. Grand Rapids, Mich.

Out

Without Delay WHY?

First: Because in our Extractor, we use a steel of different analysis than that in the taps themselves. Second: Because it is not tempered the same, for taps have to be left exceedingly hard in order to maintain their cutting edge and they are therefore brittle. Third: Because the Fingers of our Extractors are further from the axis of the tap than is any solid portion of the tap itself and they thus have a greater leverage in their favor; and Fourth: Because they are shaped to fit the grooves of the tap, using, therefore, the greatest amount of material.

Write for particulars of 60-day trial offer.

Schieren Belt Advertising Campaign a Record Breaker

Continued from page two.

ling at about one-half the price of good oak tanned leather.

The effect of this competition was felt, but it was not sufficient to demand any drastic measures. The salesmen redoubled their efforts, spread out their fields of endeavors and the house of Schieren still enjoyed its prosperity. It was not until several of their own direct competitors, leather belting manufacturers, feeling the stress of this same competition, perhaps a little more severely than Schieren, started unprecedented campaigns in the national mediums that Schieren woke up to the fact that something must be done to hold the market.

More Copy Planning Needed

But what? He was already an advertiser, belting users all over the country knew his duck campaign—they had seen ducks in all positions, doing all sorts of impossible things. But now somehow the campaign of ducks seemed inadequate. The other manufacturers had beaten him to the idea of using national mediums. He would not imitate. He was in a quandary. As the house did not boast of an advertising manager, he turned for help to several of his technical paper friends.

It was pointed out to him that, while he, to be sure, had been advertising for years, his copy had been flashy and irregular so far as it went. To meet his competition they advised him to plot out a campaign in advance, a campaign with a definite aim behind it, big enough to absolutely dominate in the fields which he hoped to cultivate directly. Mr. Schieren told them to go ahead and lay out such a campaign. They did, and they even went so far as to recommend that he hire an advertising manager acquainted with the field to manage it for the house. They came to Mr. Schieren with the largest campaign ever attempted by any advertiser in the technical and industrial field in a given period. It was positively stupendous for a technical paper campaign. When they finished reading the plan all Mr. Schieren said was, "How much will it cost?" They told him. He never batted an eye, although it was the largest amount ever mentioned in connection with the technical press. All he said was, "Go ahead." Here is the plan briefly:

To take four-page inserts in a list of papers reaching the class of prospects the company wanted to interest particularly, these inserts to be run in two colors with bleed borders to attract immediate attention. In addition to these inserts, to take full pages both in color and black and white in a run of papers, so that the whole field would be blanketed effectually. The papers covered the export, machine tool, iron and steel, mining, textile, lumber, shoe and leather papers, as well as publications in the general power plant, sugar milling and general industrial fields.

But how use the four pages? The first page is used as a "stopper" or attention getter, having some general connection with the transmission of power. The last page is devoted to the dealers, to get them back to the campaign and to push Schieren belts, to get the buyers accustomed to purchase their general supply from the dealer and to acquaint them with the convenience in case of a breakdown. It was definitely decided without question that the first and last pages should be the same in all publications—the two inside pages, however, held out difficulties. Should they be the same in all publications or should they be indicative of the various fields covered? In reality the question simmered down to "Can leather belting be standardized?" and "Would a steel mill man be as interested in a sugar refining installation as in a steel mill installation?"

If the first question is answered "yes," the second would necessarily be "yes." The technical paper men said "no," and Mr. Schieren believed as they did, so it was decided to address the two inside pages particularly to the field covered by the various publications in which they ran. The second page talks Schieren service. Sometimes a particular belt transmission problem is shown of the kind which the company stands ready to help the prospect solve. The third page always features actual photographs of Schieren belt transmission in some plant of the particular industry that insert reaches—a lumber planing mill, a machine shop, etc.

Service Department Co-operates

Mr. Schieren believes so firmly that belting can't be standardized that he has established an engineering service department for the object of helping customers solve transmission problems and incidentally to help themselves to estimate and make recommendations for installations. To inquirers a form is provided, showing details of typical belt drives, so that the prospect can indicate what methods he uses or may require. On the reverse side are spaces for giving further technical data for the company to act on in giving estimates. This is a sample of what it advertises as its service.

In putting the plan over representatives of all of the papers included in the campaign met at a luncheon at the Machinery Club in New York. The campaign was read to them. They were all more or less astonished at its magnitude. It was large enough to need their co-operation, especially in the securing of photographs, as both the inserts and the black and white pages were to use photographs of the installations in each of the fields affected.

The question of how the copy was to be handled was worked out later. The direct appeal was made to the person responsible for the purchase and efficiency of the belts in his particular shop. While he was the most sought after, every reader of the publication could not help but be impressed with the size of the campaign, and last, but not least, dealer good will was fostered in the dealer pages.

Throughout the copy inserted photographs of a real live duck, perched here and there, carry on the trade-mark idea of previous years of advertising.

The campaign has now been in force a year. Has this campaign unprecedented as it was, been successful? Has it answered its purpose? The answers are unquestionably "yes."

Results, in these days when demand exceeds production, cannot be judged with any degree of fairness. It is at the time when competition may prove keenest ever (and acute students of business are not hesitant about predicting this time when the war ends) that the effect of this advertising is expected to prove its worth.

Mr. Schieren is satisfied with the results and he is now building business good will and insurance which will stand him in good stead after the war. He saw his job and went after it. In other words, competition, instead of discouraging him, spurred him on to greater efforts. He had the courage to blast his own trail and leave the results to follow later.

Butterfield

TWIST DRILLS GEAR AND MILLING CUTTERS

(Carbon and High Speed Steel)

Prompt Deliveries

Quality

They're the happy result of a great combination of specially trained men and the finest special machinery—these Butterfield carbon and high-speed steel Twist Drills, Gear and Milling Cutters, Side Mills and End Mills, with straight or spiral flutes and plain or nickeled teeth. Their ability to serve accurately and long equals that of Butterfield Taps, Dies and Reamers — the sincere praise of a thousand users wouldn't be a better recommendation.

The Butterfield Catalog, just off the press, fully describes these better tools and how they increase production.

HOYT METALS

Nickel Genuine stands up under extreme heat

In foundries, glass works, etc., where machinery bearings are subjected to intense heat from without, in addition to the heat produced by friction, a peculiarly hard babbitt must be used. The mixing of such a metal is an exact science—a science rarely crowned with such a success as Hoyt's Nickel Genuine. This wonderful heat defier is made with scrupulous care, is always correct in mixture to an ounce, and can be relied upon to give best results where bearings are subjected to exceptional heat. **If you've had trouble with soft bearings try Nickel Genuine.**

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

ABRASIVE MATERIALS
Aikenhead Hardware Co., Toronto, Ont.
Canadian Fairbanks-Morse Co., Montreal.
Can. B. K. Morton, Montreal, Que.
Canada Emery Wheels Co., Hamilton, Ont.
The Geo. F. Foss Mchy. & Supply Co., Montreal.
Ford-Smith Mach. Co., Hamilton, Ont.
Norton Co., Worcester, Mass.

There's No Danger

When a tang twists off don't endanger the true taper and the axis of the tool by delicate grinding jobs. Insist on

Perfect Double Tang SOCKET

"Perfect Double-Tang" Sockets are easily applied—just grind a new tang below the old and broken one; almost any boy can do it—and without the least danger to the future performance of the tool.

In fact "Perfect Double-Tang" actually makes the tool 25-60% stronger than before, and is equally valuable in *preserving* new tools from tang troubles, or in *reclaiming* broken tanged tools.

ELM

Cutting OIL Will Increase Your Production

It will lower your cost of production by increasing your output, by giving you clean-cut threads, by eliminating repeats and by greatly lessening the breakage of dies.

ELM MOTOR OIL

is Carbonless and reduces friction. Maintains its body in all temperatures. Made in light, medium and heavy grades.

Insist upon getting ELM MOTOR OIL. IT CAN'T BE BEAT.

Cutting, Drawing, Motor and Floor Oils

Oldest Portable Tool Manufacturers in America

WE BUILD THEM BY HUNDREDS

Standardized Production enables us to offer this powerful Waterbury Grinder at such a low price. It grinds rapidly and accurately, all flat surfaces, dies, punches, planer, lathe, and other tools. Has adjustable table and tool rest with large radius of travel. Rigid, 3-point table supports giving great steadiness. A reliable, practical grinding outfit.

Why Base-Metal are more desirable than platinum thermocouples for measuring temperatures below
1300° C. (2400° F.)

Thwing pyrometers are furnished with either platinum or base metal thermocouples, but for the temperatures mentioned above, our experience in all lines of industry proves that base metal, **even with much more frequent renewal,** is preferable to platinum.

The full size comparison above of typical couples for the same duty indicates the greater ruggedness of even a medium weight base metal couple. Not only is platinum very much more expensive in first cost, but its contamination and crystallization are gradual with constant failing of accuracy, where with a base metal couple the accuracy remains practically constant, without frequent recalibration.

From the standpoint of service, the base-metal couple being so much more rugged, is less apt to suffer mechanical injury, yet may be renewed **six** to **eight** times without equalling the cost of platinum. Moreover, platinum is often stolen because of its high value.

Owing to its higher electro-motive force, base metal permits a more open scale on the indicator for the lower temperatures and therefore the reading is apt to be more accurate.

If you have been under the impression that your [illegible] expense for platinum couples is a necessity, let us submit data or send you a base metal couple for test. The result will be convincing and show you how to make big savings.

Is control of temperature on the instant an advantage?

Is it any advantage to bring a furnace up to required heat in less time and with less fuel and to be able to shut off the supply of fuel the minute work is done? Is it any advantage to have a workshop without smoke and soot, without chimneys and flues, without coal and ash piles?

Is it any advantage to save space and the wages of stokers?

If it is—

At half the first cost of a coal-burning furnace, own any one of the

"Mecol" Oil-Burning Furnaces

and experience all the advantages they possess.

Mecol Furnaces are used in several of the largest plants in Canada—in many small plants, too.

Ask us to send you Service Facts.

Mechanical Engineering Co., Limited

55 COTE ST., MONTREAL, QUE., CANADA

Richards Patent Sand Blast Machine

The up-to-date machine for sandblasting shells from 4.5 to 155-mm.

Will increase your output and do the work efficiently at reduced cost.

Strongly yet simply constructed; the accessibility to the working parts and the ease with which same may be interchanged, with no waste of time, is a marked feature of this machine.

Will do the work as it should be done, perfectly and without dust, whether sand, grit or shot is used.

The increasing demand and repeat orders for these machines proves their efficiency and reliability.

Price is moderate. Write us for particulars.

G & B Heat-Treating Furnaces

For Every Line of Work

When it said, "there is something new to learn about heat treating every day," a truth has been stated. But there has never yet been a real problem in heat-treating too big or difficult for GILBERT & BARKER engineers. Whatever your line of work may be, you can depend upon it, G. & B. engineers have designed, or can specially design, a furnace finely adapted to meet your specific needs.

G. & B. furnaces have made good for over half a century in plants big and small.

Manufacturers of motor vehicles, agricultural implements, fire arms, etc., depend on G. & B. furnaces for their most difficult annealing and heat-treating work.

In addition to its excellence of output you will find Gilbert & Barker furnaces economical in operation and upkeep. They use all the fuel, as the fires, whether gas or oil, are valve regulated.

In writing ask for Catalog No. 23.

Gilbert & Barker Mfg. Company

Springfield, Mass.

STEWART FURNACES

Gas or Oil

Economical of Fuel

Drop Hammer Forge

Stewart Oil or Gas Furnaces represent the most advanced method of die and tool hardening and annealing. They permit the best temperature control possible, and are *extremely economical of fuel—a highly important factor in these days of fuel scarcity.*

They heat quickly and uniformly; no smoke, soot or odor.

No matter what you heat treat, there's a Stewart Furnace that will answer the purpose exactly. We make special designs for special purposes, but our standard lines meet all ordinary requirements and are preferable as repairs are always available and much cheaper.

The Forge shown here is made in eight sizes.

Stewart furnaces sell on a genuine thirty-day trial basis. Better get our proposition. Catalog No. 61 shows over 100 types and sizes and contains reliable data on heat-treating methods. Send for it.

MAKE NAILS! NOT NOISE!

We offer the trade new types of

WIRE NAIL MACHINES

QUIET IN OPERATION; WITH VERY HIGH OUTPUT; ALL PARTS ACCESSIBLE; DECREASED MAINTENANCE COSTS; GREAT CAPACITY; OCCUPYING SMALL FLOOR SPACE.

Smoothly running machines, with balanced mechanical motions and no rotating cams. Built in 5 sizes, handling wire from No. 17 to ⅜" diam.

PRACTICALLY NOISELESS IN OPERATION

Loss of Power Eliminated by Fitting

COVENTRY NOISELESS CHAINS

to your individual Machine Tool Drives

Illustration shows Darling & Sellers Lathe driven direct from motor 10 H.P. at 900 r.p.m. to 270 r.p.m. by "The Coventry" Noiseless Chains, a transmission which causes the machine to move steadily, while the output is rapid and continuous.

Write for our handbook C-3 on chain gearing. Post free for the asking.

Head Office and Works;

Cables: CHAINS COVENTRY

COVENTRY ENGLAND

Codes: A.B.C. 4th and 5th Editions Western Union

Don't Crowd Your Large Machines

You cannot manufacture small parts economically on a large machine. Steptoe Small Power Feed Millers and Hand Millers are especially adapted for that kind of work, a stiff, heavy tool that can be quickly handled and crowded to the limit. That is the machine to buy for small parts.

If your Planers are crowded take the small jobs and put them on a Steptoe Shaper and you will do them quicker and you will have less money invested in equipment.

STEPTOE SHAPERS "Just a Little Better."

CIRCULAR ON REQUEST.

John Steptoe Co., Cumminsville, Cincinnati, Ohio, U.S.A.

Canadian Representatives: Garlock-Walker Machinery Co., Toronto, Ont.

24-INCH INSTANTANEOUS CHANGE GEAR LATHE

This double back-geared lathe has been designed to meet the most exacting requirements of modern machine shop practice. Pitches and Feeds are instantly obtainable without the removal of a gear. Double Apron is of the most rigid construction possible, preventing overhang and straining of pinion and studs. Half nuts are of cast iron.

Spindle is of 75 point carbon crucible steel and runs in phosphorous bronze boxes.

Carriage has bearing entire length of Vs on bed, gibbed both front and back. This lathe has reverse in the head for screw cutting; all feeds reverse in the apron. Power cross feed, etc. Mechanism so arranged that longitudinal and cross feeds cannot be engaged when cutting screws.

GREAT DRIVING POWER

CHARACTERIZES

This C.M.C. Triple-Geared Engine Lathe

C.M.C.

It embodies all the general features and mechanical excellence that so distinguished our entire line of engine lathes and in addition has special features that make it particularly valuable for heavier work.

A Few Features

Built in sizes 36″ and 42″.
Has four step cone, for wide belts.
Powerful triple geared to face plate drive.
24 spindle speeds.
Rack and Pawl support for tailstock.
All steel gears in apron.

SMALL TOOLS

P. & W. Combination Lathe Knurling Tool

Combines Three Distinct Knurling Tools in One

You will save time by using this three-in-one Lathe Knurling Tool. It carries three pitches of knurls, fine, medium and coarse, as shown in sample. This does away with necessity of having three holders or of changing knurls where but one holder is available. Same knurls can be used in this holder as are used in our regular Lathe Knurling Tool.

Fine Medium Coarse

TORONTO AUGUST 8, 1918

The Wisdom of Advertising When Oversold

ASK the "man in the street" to call the roll of talking-machine manufacturers, and he will name three almost certainly, four probably, and perhaps will go as far as five or six before his knowledge of the subject is exhausted. But ask him for the name of the leading concern in the industry and ninety-nine times out of one hundred you will get the same answer. The wisdom of the Victor Talking Machine Company's policy of continued advertising when the factory is oversold can be demonstrated by so simple a test as that.

Our neighbor, the *Dry Goods Economist,* points out that the talking-machine business is no longer a specialty proposition, requiring expert handling. The public at large is so thoroughly familiar with the idea of owning a machine and operating it that the department store can profitably enter the field and sell the line on a merchandise basis. And certainly there are plenty of available sources of supply. We counted the ads. of twenty-six different manufacturers in a single issue of a trade-paper, and that is by no means the complete roster. Some of them are also advertising to the consumer, others are not, yet the fact remains that the immense prosperity of the industry is attracting a multitude of concerns which intend to share it if they can. The leaders have done the pioneer work of educating the public to the talking-machine idea, and now let them look to their laurels!

The same thing has happened before in many other lines of business. We can name concerns which once were leaders, but which have gone down under the pressure of just such competition as is now threatening the talking-machine industry. Prestige meant little to them so long as they got the business; they felt that their standing was secure because the factory could not keep ahead of its orders. They regarded advertising as a useful means of getting more business, but why advertise when we don't need business?

There is little likelihood that leaders in the talking-machine industry will be deposed, for they have not advertised merely to "get business." Their advertising has represented in large part an investment in good-will—the laying up of a fund of public confidence which could be drawn upon whenever it became necessary. The wisdom of that policy will become more and more apparent as time goes on.—Printer's Ink.

The Needs of the Empire

NEVER BEFORE in the history of Canada has greater opportunity been offered her Sons and Daughters to render SERVICE to the Empire;—and

NEVER BEFORE have the needs of the Empire demanded as high a standard of QUALITY in thought, deed and product as at present.

HOW NOBLY CANADA has responded is now known around the World and history will record it for the future.

THE PRODUCTS OF OUR MILLS are at the Fronts and on the Seas, in the Shipyards and Factories and in the Fields, faithfully fulfilling their mission of reliable performance wherever the Government's War-Winning Programme directs, as we are, and have been, stripped for action since the first call to arms.

THE NEEDS OF THE EMPIRE are many and the War-Winning Programme changes as necessity demands; but it matters not, the needs of the Empire are paramount and must be supplied.

THEREFORE, if in these trying times, we do not deliver promptly to you such of the products of our Mills or Blast Furnaces as you may need, console yourself with the thought that through us, you are rendering Service to the Empire and to the Cause that matters most for the Liberty, Justice and Freedom of the World.

Uranium High Speed Steel

Uranium Tools Meet Increased Demands

The tremendous increase in the demand for faster production made upon machine tools is met by replacing other cutting tools with those made from Uranium steel.

This steel—produced by adding Uranium to the best grade carbon steel—has great toughness and strength.

Therefore tools made from this steel permit deeper cutting with greater speeds. This results in an increased production.

Why not try a tool? Consult your steel man, or write us.

MANUFACTURERS OF WELDED STEEL SPECIALTIES
THERMIT OXY-ACETYLENE and ELECTRIC WELDERS

If You Need a

POWER HAMMER

of uncommon strength throughout—a hammer constructed to deliver work of surpassing quality in great quantity, and to keep everlastingly at it—

You Need Jardine's

Note a few particulars:

Hammer slide is a steel casting: so is the ram, and connecting bolts for the ram are machined from solid steel bar.

Hammer and anvil dies of properly tempered, highest grade tool steel are held in machine seats by tapered keys in the ram and anvil block, so there's no need to put taper on the dies.

Jardine's Canadian Giant Power Hammer has never failed.

Roelofson Banding Machine

for 75 mm. and 155 mm. Shells.

Excellent Delivery

Our manufacturing facilities are such that we can make excellent delivery on machines for the above sizes. To shell plants changing over to the 75 mm. and 155 mm. shells this should be of especial interest.

Experimenting in Munition Making is Past

AND likewise experimenting in munition machinery is past. The "experiments" are all in the discard and only the machines properly designed and carefully built have survived.

Roelofson Band Turning Machines have stood up consistently under three years of the severest service possible. They have met every requirement of production and serviceability and are still doing duty in many Canadian munition plants.

Don't experiment with your 75 mm. and 155 mm. shells. Use the machine that has a record of three years of service behind it.

Note these features of construction:

Integral (en bloc) construction assures perfect rigidity, permanent accuracy and desirable compactness.

Chucking with spring collet chuck insures accurate and speedy chucking.

Graduated feed dial, two cutting tools, and ample belt power insure output of accurate work in least possible time.

Machines are also built for 15, 18, 60-pdr. and 6-in. shells.

16-inch double back geared Whitcomb-Blaisdell Lathe

The Material That Goes Into It—

That is the firm basis on which the **durability** of the Whitcomb-Blaisdell Lathe is founded. The head spindle is of 65 to 70 point carbon steel—the spindle bearings of a specially developed bronze—the beds of semi-steel castings—in fact, every detail is built of the best material obtainable. That construction, combined with the smooth, easy running secured by close accuracy, gives every Whitcomb-Blaisdell Lathe the ability to **stand up** under long, hard service.

Write for Catalog covering the entire line.

LATHES From 14" to 30" SWING

THE GRIP OF THE JACOBS IMPROVED DRILL CHUCK

Positive---Dependable ---Firm

This sturdy grip is but one of the many reasons why Jacobs' Chucks find favor in the modern shops of the world.

It's so easy to quickly clamp a drill, tap or other tool in these solid jaws.

Grasp the key in either hand—insert in the nearest hole in the sleeve—a mere twist of the wrist—it's done.

Just one of the Many Points of Superiority of Jacobs Chucks.

Not an experiment—but a Success.

JACOBS MFG. CO. HARTFORD CONN. U.S.A.

Simplicity Power Control

These three essential elements predetermine output.

AMALGAMATED belt driven machines are set up under a line shaft, without any countershafting, as you would a drilling machine or a punch press. They will safely transmit all the power that can be delivered to them. Simpler or more effective controls have never been provided on any machines for such work.

For these reasons minimum installation expense, maximum output, operation by unskilled labor and an uninterrupted production are all possibilities when the machines are AMALGAMATED.

Information and details concerning ***Ammunition*** *and* ***Ordnance*** *machinery upon request.*

Two Tools Work in Same Cut

Peerless HIGH SPEED

A New Standard in Metal Cutting Increases Production 50% to 100%. Saves in Time, Labor and Material.

Take the older standard saws, some of which have been deservedly regarded as excellent machines, and add 50 to 100 per cent. to their output, and you will come pretty close to the productiveness of the Peerless High Speed. It has created a NEW standard of production, which is all its own.
Repeat orders tell the story. Some of them come from manufacturers who have had to wait for Peerless machines when they could get others at once, paying heavy express charges to get them quickly.
The Peerless High-Speed saves in time, labor, blades and material. It cuts faster, with a thinner blade, with less attendance and with a smaller consumption of saw blades than any other metal saw made.
Order a "Peerless" on 30 days' trial. We pay freight BOTH WAYS if it fails to make good.

PEERLESS MACHINE CO.
1607 RACINE STREET RACINE, WISCONSIN

For Rapid Production and Accurate Work

USE THE

"BRIGGS"

The Briggs Miller handles work no other machine of its size can touch. It is a manufacturing machine.
On account of its rigid construction it will produce accurate work when running at a high rate of speed and feed.

The Base Tank and Large Gear Pump is the latest addition to its many advantages. Tank holds 20 gallons of cutting **lubricant**.

Pump never requires priming and will deliver ten gallons per minute to the cutters, keeping them cool when run at very high speed.

Our booklet describes fully. Drop a card for it.

Alundum Wheels for Crankshaft Grinding

The following is quoted from an article by an authority on crank-shaft grinding:
"If the shaft is made of a hard, heat-treated steel, a 24 combination, grade M, Alundum wheel is used for both roughing and finishing. If the shaft is made of comparatively soft steel, a 24 combination, grade N, Alundum wheel will be better for roughing, and a grade M wheel for finishing. These two wheels will handle any unhardened crankshaft. If the shaft is pack-hardened, a grade K wheel is necessary."
The above recommendations relate to the larger types of crankshafts; cranks of small sizes are rough ground successfully with Alundum grain 36, grade O, and sometimes grade P.

Volume XX. No. 5. August 8, 1918

Your "Uncle Sam" is Not a Bluffer in Any Sense

A Review of His War Activities Will Demonstrate That He Has Gone in for Keeps—In the Past He Has Shown a Tendency to do Things in a Big Way and at Once

By GEO. A. SIMPSON, Sales Manager Steel Co. of Canada.

NOTWITHSTANDING the following, which I clipped from a Canadian paper, your "Uncle Sam" is not a bluffer, and this the Hun will find out to his sorrow:

Washington, July 9.—Publication in Swiss papers of the text of Secretary of War Baker's letter to President Wilson, giving the American troops' movement to Europe by months, caused German authorities to permit its publication in Germany, according to a despatch received from Berne.

The *Koelnische Zeitung* published the latter under the heading "American Bluff," the despatch says, and commented as follows:

"Mr. Baker thinks he will be able to dissipate all doubts about exactitude of his figures with his recitations. It is, however, only the usual American bluff. We know from reliable sources that the figures in question are inordinately exaggerated and in no way correspond to the truth."

And furthermore, he will understand—if he does not already know—that the figures furnished by Secretary of War Baker are not "inordinately exaggerated," but they do correspond to the truth inasmuch as they only represent a small fraction of the force that will be exerted for the cause of humanity before the allied armies reach Berlin.

A Nation of Enthusiasts

The American is an enthusiast, fostering an ambition unbridled by traditionary restraint, for in him commingles the souls of the sturdy Pilgrim Fathers, beset with the cares of existence, conquering nature, felling trees, navigating rivers and fertilizing valleys, and the souls of the Colonists fighting for liberty and independence. He is the child of a country as boundless as the ocean, whose rivers are like rolling lakes, and the lakes like inland seas, the forests, the mountains, the plains, Niagara itself with its world of waters—all owe their magnificence to their immensity; and by transference, not unnatural although fallacious, the Sons of Uncle Sam have modelled their ideas and expressions on the huge scale of their magnificent country, and history proves that anything they have seriously set themselves to do, they have successfully accomplished. But this is to his credit, as nothing great has ever been accomplished without enthusiasm, but he is not a bluffer.

It is true, and I must admit that the words "bluff" and "bluffer" are often applied to American statements and to those who make them. As to why they should be applied to the extent they are, I am at a loss to understand, unless it is through the application of a mental attitude that parallels, in a sense, that of the German toward the English. During the course of the war, I have been asked a number of times by residents of the United States what has England done to incur the hatred of Germany—as no one seems to question that a deep-seated hatred does exist—and to those who first propounded the question, I was at a loss to make an answer. Therefore, I undertook to analyze the subject and I asked myself the question, "What has England done to Germany?" and for the life of me I could not reach any logical conclusion, other than the one I will later outline which justifies in the German mind the Song of Hate, or the toast of "Der Tag" which, in English, is "The Day," meaning the day on which they could pick a fight and thereby show their brutal superiority over a race that they recognized, but would not admit, were their superiors in every commendable particular. I have therefore concluded that their hatred is caused by a mental attitude, born of the fact that the Englishman is a gentleman and as such is recognized by every nation with whom he comes in contact.

Mighty Handy With a Knife

I have before me a mental picture—not altogether imaginary, as I have attended gatherings where different nationalities have sat at the same table—and I can see the German, fat and coarse, with his napkin stuck inside his collar, disposing of his soup with musical accompaniment, using his knife and fork with the same elegance that a plumber would use his tools; in fact, the knife is more to his liking than the fork. I have watched him through the meal, ill at ease, feeling that he was not in harmony with the thought and environment of representative men. I have seen him called on to make a speech, or responding to a toast, rising awkwardly and even where he could speak good English, it sounded to me like someone gargling his throat. In other words, the German is coarse; he is the offspring of a race of butchers, soap-boilers and brewers, and he knows it and shows it. On the other hand, across the table the Englishman, respecting all the good manners recognized in well-ordered society, is called upon to respond to a toast, and with the grace of a Chesterfield, he rises to the occasion and in a few well-selected words, he makes his response. The German knows he is not the equal of the race from which this gentleman sprang, and therefore dismisses the subject by saying under his breath "Englander Schwein."

But the English are not swine, neither is your Uncle Sam a bluffer, yet a state of mind has been created and does exist all over the world, including Canada, which prompts the dismissal of a statement, involving big figures or vast undertakings, made by an American, as "American bluff." To this I have applied the test and I wish to go on record and state in the most emphatic language, that all through the history of the United States I cannot find one instance where statements have been made which, I will admit, sounded like "bluffs," which have not been fulfilled. And I can only conclude that the reason the word "bluff" or "bluffer" has been applied by the peo-

ple of every nation, who do not realize the stride your Uncle Sam is making, is because they cannot grasp the magnitude of the statements made and they dismiss the subject as "American bluff," while those who do realize it, resent it with the same remark.

Their Declaration of Independence, whereby they severed their allegiance from a crazy German King, sitting on a British Throne, was no bluff; neither was the Emancipation Proclamation, which gave freedom to the slaves, a bluff.

Couldn't Grasp the Idea

As a slight indication of the extent to which the word "bluff" or "bluster" has been applied to the inventive minds and the unbridled energy of the American people and as to how poorly it served as descriptive of their accomplishments, I may state a little incident that I well remember and have many times repeated. I was standing on the railroad platform in Newport, Monmouthshire, awaiting a train to take me to my home. I was then a boy, attending a British Public School. There were a number of other passengers waiting for the same train, among them being the vicar of the parish of Trevethin, a well known and renowned clergyman of the Church of England. He was talking to some farmers, who lived in his district, and the conversation ran about as follows: He told them that he had received a letter from a former member of the church, who had emigrated to America, stating that there had been invented and there was now in use in the United States a machine that while being drawn through the field, would cut the wheat, put it up into sheaves, bind it and drop it, ready for being put into shocks, as it went along.

The conversation was interesting to me as, boylike, I had profound respect for the vicar. I now recall the expression of doubt on the faces of the farmers, and the smile from the vicar who acquiesced with their thoughts, and I can now hear him distinctly stating that he very much doubted that such a machine could be made and applied in general use, with which the farmers, who were at that time cutting their wheat with a sickle, were very much in accord.

When we consider what the sons of Uncle Sam have done for the agricultural world and realize that their first attempts were classed as "bluffs," we can more fully appreciate how ridiculous and uncalled for the expression is. And what applies to the endeavors of Uncle Sam in the production of agricultural implements applies to everything he has seriously undertaken.

Three Days vs. Four Weeks

As a boy I went to sea in an English sailing ship, and I remember very well my first introduction to what I then considered "bluff." We had crossed the Atlantic from England to the West Indies with a cargo of coal and had run down to Pensacola, Florida, for our return cargo of lumber. After we had discharged our ballast, we were towed out into the bay, where our complete cargo of logs had been rafted and was there awaiting us. I remember hearing the stevedore, an Irishman, by the way, by the name of Pendleton, who had lived the best part of his life in the United States, telling his gang that he expected to load the ship in about three days. While I was a very young boy at the time, I shook my head and if I didn't say "bluff," I thought it. Notwithstanding we were loaded and ready to sail within the prescribed time and we arrived in England some ninety days later, where it took the English stevedore and his force some four weeks to unload what the American gang had loaded in a little over three days. No bluff about that.

Some years later I was on the Isthmus of Panama. It was shortly after the collapse of the French company, who had undertaken to build the canal. All the machinery and equipment was lying in idleness and rusting. The Isthmus was reeking at that time with yellow fever and disease and any man who spent much time there took his life in his hand. I was then advised it was impossible to build the Panama Canal, and to drive home this statement, my advisers, pointing to Monkey Hill, which in those days was the famous burying ground of the workers on the Isthmus, said there were more men buried in the cemetery on that hill than there were ties in the Panama railroad. In later years Uncle Sam undertook to "dig the ditch" and the first thing he did was to clean up the Isthmus from ocean to ocean. The greatest sanitary engineers the world knew were put on the job and when this part of the work was done and the Isthmus made fit for a white man to live on, that great organizer, Major Goethals, the canal builder, was ordered by President Roosevelt "to make the dirt fly." As to how well he did this work is now a matter of history; but the facts are the work on the canal, especially any reference to the gigantic dredging operations, were often referred to as Amrican bluff, and when the date set for the completion of the work was mentioned, it usually brought forth the stereotyped reply, "bluff." Nevertheless, the canal was completed and ships passing through it fifteen months prior to the official date set for its completion. Surely this cannot be termed "bluff."

They Came—They Saw

If my memory serves me right, it was in the year 1890 that the British Iron and Steel Institute visited the United States as guests of the American steel manufacturers. At that time I was associated with the T. A. Gillespie Co. We were laying natural gas pipe lines into the city of Pittsburgh and some of our construction records had evidently reached England. When the members of the Institute reached Pittsburgh, it was my pleasure to take charge of a party of six to conduct them through the steel mills at Homestead and, incidentally, outline to them what was being done in connection with the bringing of natural gas into the city. In my party was the president of the Institute, Sir E. Windsor Richards of Middlesboro Mr. Clement Crowther, of Crowther Bros., Kidderminster, and Mr. Isaac Butler of the Panteg Steel Works. in whose mills I had worked in England, also a number of others, all of whom were descendants of families long connected with the iron and steel industry.

I recall now the statements they made on going through the mills and their utter amazement at what they termed "the gigantic buildings" and what in their minds was the enormous output, which these mills were producing. They told me then they had heard of these big undertakings, but had discounted them very largely, as they thought it was merely "American bluster," but they were satisfied that what they actually saw was greatly in excess of what had been reported.

When I showed them the gas lines, which passed very close to Homestead before crossing the river into Pittsburgh, and stated to them that we had secured and cleared the right of way, dug and filled in the ditch and laid eleven miles of 36-inches diameter continuous steel piping in less than five months, they were astounded and Mr. Crowther remarked that at home (meaning in England) they would not have concluded the debate in Parliament in that time as to whether the right of way should be granted or not.

Making of Tin Plate

It was just about this time that the subject of manufacturing tin plate was being considered seriously in the United States, and I so advised these gentlemen, and while they were willing to admit that all the statements that had been made in reference to pig iron and steel had been more than fulfilled, nevertheless it was not possible in their mind for any one to take Great Britain's place in the production of tin plate. They were

inclined to jokingly infer that my statements in connection with this industry bore a little resemblance to "bluff." I may state that to-day the United States leads the world in the production of tin plate, likewise pig iron and iron and steel.

There was no question as to the effect of what they saw on the minds of the members of the British Iron and Steel Institute, or as to the benefits obtained through their visit, as they all returned singing the praises of your Uncle Sam and voted unanimously that he was not a "bluffer." And on the Americans, who had come into contact and associated with this magnificent body of representative Englishmen, the impression was indelibly stamped that they were gentlemen in every sense of the word.

I could go on indefinitely reciting statements that were regarded as "bluff," but which were fulfilled to the letter. While the Alfonsos and Isabellas sneered at what they termed "American bluff," your Uncle Sam was not bluffing when he lifted the heel of Spanish tyrrany from the neck of the Cuban and cleaned up the Island of Cuba and dredged the harbor of Havana and thereby got rid of the filth of centuries, which made this beautiful island a hot bed of bubonic plague and yellow fever. As a result to-day there is no more beautiful spot on the Western hemisphere than the Island of Cuba and the city of Havana. It is true, while doing his work, he lost by death, through yellow fever, an eminent sanitary engineer, but he completed the job and made good his wildest statements. And what is more—he paid the bill and to-day Cuba is proud to be recognized as a protege of Uncle Sam.

The Boxer Incident

And while I am referring to paying bills, I might state that during the Boxer Rebellion in China, when the six big nations of the world undertook to quell the disturbance, they all went in with the understanding that China would pay full indemnity for every expense incurred in the undertaking. After the work had been accomplished and the civilized nations had withdrawn, which, by the way, does not include Germany, as she stuck and took possession of Tsing Tau Peninsula and refused to be dispossessed, maintaining that she was holding this possession as payment for the expense she had been put to, they rendered their bills—which ran into enormous figures—and all of them are being paid with the exception of the one rendered by your Uncle Sam, which he returned to China marked "paid in full," with thanks for the privilege of being given an opportunity to render such a service to humanity. Surely this is not "American bluff."

The feeding of Belgium in the early part of this war was no bluff; neither is the feeding of the Allied armies to-day, or that part that your Uncle Sam has played in this great war from the beginning. Referring to the feeding of the armies to-day, I am reading from an address made by Sir William A. M. Goode, an officer of the British Food

Ministry, before the Consumers' Council, in which he gave striking figures, showing how the people of the United States by self-imposed food restrictions have aided greatly in maintaining the food supply of the armies in the field. Sir William said:

> "From July, 1917, to April, 1918, the United States exported to the Allies 80,000,000 bushels of wheat products. It was calculated by Herbert Hoover, United States Food Administrator, that fifty million of this represented the voluntary sacrifice of the American people. American exports of pork products to the Allies in March, 1918, were 308,000,000 pounds. This was accomplished by porkless days and ceaseless hog production in the United States. In January, Sir William continued, the Allies asked Mr. Hoover for seventy million pounds of frozen beef monthly for three months. In March 86,000,000 pounds of frozen beef were shipped. This was due almost wholly to meatless days in the United States."

Had this statement been made by an American, it would, no doubt, have been dismissed as "bluff."

I would like to furnish some more figures and I would if space permitted, but suffice to say it required more than bluff to supply Great Britain and France with over 1,500,000 horses and mules; millions of tons of steel and shell forgings, hundreds of thousands of tons of barbed wire, and tens of millions of completed shells, machine guns, revolvers, together with hundreds of millions of pounds of powder and cordite to assist in delivering these shells into the ranks of the Germans by way of British guns. Add to this the enormous quantity of machine tools and equipment that was shipped to England and France, which enabled them to speed up and take care of their own requirements. Add to these transports, trench diggers, tanks, automobiles, medical supplies, clothing, shoes—in fact, mountains of supplies—that were absolutely necessary for the very existence of the allied armies in the field. We grant he was paid for all this, but that he was entitled to. What I wish to bring to your notice is the magnitude of this undertaking and the manner in which it was carried out, and many times during the early period of the war I heard statements made by these American producers, who had undertaken this magnificent work, referred to as "American bluff."

Some 1918 Accomplishments

The building of the Liberty Mill at Homestead in six months for the rolling of ship plates, the construction of a one-hundred-million-dollar ordnance plant on Neville Island in the Ohio River, near Pittsburgh; the building of shipyards from ocean to ocean and the launching of ninety-four ships on the Fourth of July are merely incidents in the vast war programme mapped out by Uncle Sam. Yet any one of these undertakings is stupendous. They form parts of the American war machine, and you can take it from me that when this force gets properly started, there is no power on earth can stop it. It is no bluff; it is Uncle Sam's contribution to a righteous cause, and shoulder to shoulder with his Allies, he will drive it across the Rhine.

While I know from experience that the great majority of Canadians fully realize and appreciate that Uncle Sam is a good neighbor and that he is not a bluffer, I also know there are small cliques of narrow-minded individuals in Canada, who are earning their Iron Crosses and doing good work for the Kaiser by sneeringly applying to all

things American the word "bluff" and thereby attempting to discount their most sincere efforts. Such individuals should, in my judgment, be reported to the proper authorities, where they would be given an opportunity to prove whether their remarks were merely expressions of their personal opinions, or whether they were paid for with German gold.

The Wrong Viewpoint

An incident I shall ever remember and long regret happened on a train some months ago. I was sitting in the parlor-car. We were leaving Hamilton, going to Toronto with a friend, and across from us sat the president of a large Canadian manufacturing company. He was reading a Buffalo paper and evidently some of the headlines did not please him. Handing ths paper to me, he pointed to an article and remarked: "What do you think of that American bluff?" The article referred to a loan of a few billions to the Allies and incidentally spoke of helping to deliver the punch that would knock out the Hun. I saw nothing objectionable in the article and called his attention to the fact that he was reading an American newspaper, and I further stated that, in my judgment, the help we would get from Uncle Sam was necessary and that had the United States not entered the struggle to take the place of recreant Russia, Germany might have forced a peace of her own devising upon the Allies, to which he objected, stating definitely that he would rather see the Allies beaten than have that bluffer take any of the credit. The cruelty of this remark was sufficiently effective to stun both of us, to whom it was directed, and while we felt like beating him up, or handing him over to the police, we ignored him; but not without taking his mental measure and concluding he was either crazy or profoundly pro-German, preferably the former.

I fully realize that Canada could exist without her neighbor; but it would not be a very modern existence, neither would it be a very progressive one. But I also realize that we can get along much better with the United States than without. We are absolutely dependent on Uncle Sam for a whole lot of our comforts. Take hard coal for one—yet notwithstanding there was a great shortage last year due to the war, it is a fact, the homes of Canada were more comfortably heated than the homes in the United States, and I know that the orders from Washington relating to the distribution of certain materials were positive, as a prominent official there told me that Canada was being treated as one of the States. This spirit prevails and governs the actions of Uncle Sam in all his dealings with Canada.

Canadians should not forget that Anglo-Americans wrote the Declaration of Independence and the Constitution of the United States; they produced George Washington, Abraham Lincoln and Woodrow Wilson; they were the makers of trails and the givers of laws; they opened up the American wilderness; they drove the roads and bridged the streams and the roads they drove were straight and the laws they gave were broad and kind, and to-day the eyes of the world are looking west for they know that your Uncle Sam is not a bluffer. They are beginning to realize what America stands for.

The Spirit of America

My message is prompted by the most sincere thought and best wishes, because I want Canadians especially to know what the spirit of America is. I want to get into their very souls the passion and love for the sons of Uncle Sam that the sons of Uncle Sam have for them. I want them to understand that their heart is as great as the nation over which their emblem of liberty flies, and what is more, it beats true and in sympathy with all that can be termed human fellowship. It is consecrated to the highest ideals of humanity in its noblest form. The spirit of America is liberty, but it does not invade the rights of others, for it well knows that to enjoy liberty, it must extend it to others. It pleads for the rights of men to think, to reason, to investigate to the end, that the future may be enriched with the thoughts of honest men. It implores every human being to be a soldier in the army of progress, and it extends to him every right it claims for itself, believing that when all men give to all others all the rights they claim for themselves, the world will be civilized. Uncle Sam has had his difficulties, but they have stimulated, rather than stifled, his energy and the spirit of America, born of liberty, justice and truth, has surmounted a greater variety and combination of obstacles than I believe ever fell to the share of any one people in the same space of time, and to-day it is returning to the world the fruits of the belief that the universe was planned for good and the blessings of Creation were intended for the admiration and benefit of all mankind.

STORAGE OF COAL

Some notes on the storage of coal with reference to the prevention of spontaneous combustion were given by Mr. John H. Anderson before the Institute of Marine Engineers, London.

The author said that his remarks were based in particular on experience gained with a heap containing just over 16,000 tons. The heap consisted entirely of small bituminous coal, of several kinds, washed and otherwise, some being of a character supposed to be dangerous for storing. Under these conditions extra care was exercised. Temperature readings were taken at 14 different places nearly every day, and occasionally also at the vent pipes, of which there were 50. Further, to find the hottest part, readings were taken at every foot from top to bottom at certain places. Previous experience indicated that the warmest place was between 6 ft. and 8ft. from the surface; hence 7ft. was established as a standard depth for temperature records. The temperature tubes were ¾ in. or 1 in. gas tubing, driven in from the top to the bottom of the coal and long enough to project 2 ft. or 3 ft. above it. In most cases the vent pipes were old scrap tubes about 8 ft. long and 3 in. or 4 in. in diameter, and were driven down to the 7 ft. mark, their ends being flattened, chisel-shape, to facilitate driving.

By taking periodical readings of the temperature of the pile and comparing them with previous readings ample warning was obtained to prevent a fire. If a readying of 90° F., which was adopted as a warning temperature, was obtained at any place four other temperature tubes were driven down north, south, east and west about 10 ft. from the warm tube. The tube which gave the highest reading next day was then made the centre, and other pipes put down in its direction, the idea being to locate the source of heating. When the warmest place was found an additional vent pipe would be put in there, and this generally arrested the rise of temperature. If, however, it did not, a trench was dug a foot deep on each occasion—that is if the readings remained at, say, 100° for three days the trench would be 3 ft. deep. In fact a temperature of 100° was never reached, but on four occasions, when 95° was recorded at a point where the coal was deposited to a depth of 16 ft., a trench was dug. Probably, however, this trenching would have been unnecessary had additional vent pipes been inserted. If a fire occurs, although plenty of water should be available to quench it, it is better to dig all round it, and if possible remove the hot coal.

In general the depth of the heap should not exceed 12 ft. to 14 ft. for small graded coals, or 9 ft. to 12 ft. for unwashed mixed coals. As regards slacks, a good deal depends on the composition. The author allowed two heaps of this material 10 ft. deep to rise to 120° before moving them, and they gave considerable trouble; even when they were reduced to 6 ft. there was a tendency for them to increase in temperature. Anything, such as pieces of wood, pit props, rags, waste, shavings, and straw, that ignites at a lower temperature than the fuel should be kept out of the heap. As a rule the greatest danger is up to about three months from the time the coal is taken out of the pit.

APPROVAL VS. CRITICISM

I am a believer in the fact that men do their greatest accomplishments by proper encouragement, not by criticism. I have yet to see the man, however great and exalted his situation, who is not susceptible to the approval of his fellow-man. I have yet failed to see the man, who is worth calling a man, who does not put forth his best efforts under the approval of his fellow-men. And the severest criticism that can come to any man is not to find fault with him, but not to notice him at all.—Schwab.

Changed Hands.—John T. Hepburn, Limited, of Toronto, has taken over the plant of the Martin Pump & Machine Company, 47 Dawes Avenue. The intention is to manufacture Hepburn special shell lathes for the present, and later a complete line of steam and water pumps.

New Plant of the Fred Thompson Co., Montreal

Growth and Development of the Electrical Business and the Increasing Demand for All Sorts of Equipment Has Brought With it the Necessity for Greater Buildings to Handle the Work

FEW activities of the present have shown such remarkable developments as that of electrical industry. Much of this expansion has resulted through the agitation for greater fuel conservation, so that many firms in the electrical branches have required additional plant facilities to handle the increasing business. The Montreal firm of Fred Thompson Company Limited, one of the oldest and best known in the electrical industry throughout the Dominion, has recently erected and occupied a new three-story factory on Genevieve St., a short distance from their previous location on Craig Street, where they had been carrying on business for the past nineteen years. This firm had its origin in 1894, being first founded by Fred Thompson, a pioneer in the electrical business. Mr. Thompson came to Montreal in 1882 and held the position of chief electrician with the old "Royal" Electric Company, for nearly twelve years. The initial office of the present firm was located in a small room of the old Temple Building on St. James St. Under the capable leadership of its present head the company had a steady expansion, the culmination being the recently well equipped and modern establishment.

NEW PLANT OF FRED THOMPSON CO., MONTREAL. SECOND FLOOR WITH OFFICES IN THE REAR.

A Well Built Place

The new three-storey and basement building has a total floor space of over 30,000 square feet, and is of brick and concrete fireproof mill construction, well lighted from three sides with metal sash windows. Fire doors are provided on the floor level of each stairway, each door fitted with fusible links. The various floors are arranged to accommodate the different departments to the best advantage, facilities being provided to handle the work rapidly and economically. The top floor is fitted out as a drafting and designing room, storeroom, pattern room, transformer department, and the coil making department. The front section of the second floor is reserved for the general and private offices, while the back portion is equipped for repairs and testing of the smaller electrical equipment; here all general repairs, winding, assembling and testing are carried on. A portion of this floor is set aside for impregnating and baking of the parts. Located on the concrete floors are the dipping and impregnating tanks and the electrically heated baking ovens, with an overhead travelling crane that handles all motor parts, heavy coils, etc., between the tanks and the ovens. This department with the switchboards and accessories is amply provided with the necessary facilities for testing at all voltages and also at any of the frequencies desired on alternating current, and also at any of the required voltages on direct current equipment.

NEW PLANT OF FRED THOMPSON CO., MONTREAL. GROUND FLOOR WITH SECTION OF MACHINE SHOP TO RIGHT.

The receiving and shipping room is located on the ground floor, also the general show room, conveniently arranged for the display o fall new and ready-for-sale second-hand machinery. The rear portion of this floor is reserved for the machine shop, and a general repairing and assembling department for the heavier equipment. In the basement are located the presses and machines for punching and cutting the discs for the stators and rotors, and also for the in-

duction motors manufactured by the firm. Storage space is also provided for second-hand machinery, motor castings, pulleys, heavy hardware, etc.; also the heating apparatus.

Each floor is provided with overhead runways for portable chain blocks to facilitate the handling of the work. A Turnbull freight elevator operates from the basement to the top floor to transfer material from one department to another. Accommodation in the way of wash rooms and toilets is provided for the workmen.

This company makes a specialty of electrical repairs of every description—from fan motors to the largest electrical units now in use. They also manufacture induction motors up to 25 h.p. capacity and expect in the near future to enlarge in this connection. They design and construct electrical equipment of all kinds, transformers, magnetic apparatus, coils, etc., for special purposes. They buy, sell and exchange new and second-hand electric motors, generators, etc., guaranteeing all repairs that go through their factory. The new factory was designed and constructed by Jas. H. Hunter of Montreal. The present officers of the company which was incorporated as a joint stock company in 1913, are: Fred Thompson, president and general manager; Clarence Thompson, vice-president and secretary-treasurer; H. A. McPhee, superintendent; A. Walker, and J. B. Lacroix, electrical engineers.

NOTHING LIKE SYSTEM

"Don't tell me you can't remember things!" said Tom to John. "Memory is all a matter of system. Now, in what year was the battle of Agincourt fought?"

John pleaded that his memory failed him on that interesting historical fact.

"Exactly!" replied Tom. Now, how many days are there in a week?"

"Seven," came the answer.

"Very well. Twice seven is fourteen. Multiply by a hundred—fourteen hundred. Number of days in June, thirty. Half of thirty, fifteen. Fifteen and fourteen hundred?"

"Fourteen hundred and fifteen," murmured John.

"Right! That's the year the battle was fought. System, my boy, That's what does it—System."

AN UNSOPHISTICATED WITNESS

On a recent public occasion Chas. M. Schwab had occasion to refer to the coaching of witnesses and told of a foreman who worked for him once, who had come to Washington to appear before a committee that was investigating something. "I thought I had him pretty well coached; I thought I had him well trained what to say. I sat in the corner and watched him and presently found that he was straying a little from the training, and I shook my head at him, and in old-fashioned mill style he looked at me and said, "Well, damn it, Charlie, that's what you told me to say."

DESCRIPTION OF LIBERTY MOTOR AS AUTHORIZED BY WAR DEPARTMENT

The War Department authorizes the following statement :

The designs of the parts of the Liberty engine were based on the following:

Cylinders—The designers of the cylinders for the Liberty engine followed the practice used in the German Mercedes, English Rolls-Royce, French Lorraine-Dietrich, and Italian Isotta Fraschini before the war and during the war. The cylinders are made of steel inner shells surrounded by pressed-steel water jackets. The Packard Company by long experiment had developed a method of applying these steel water jackets.

The valve cages are drop forgings welded into the cylinder head. The principal departure from European practice is in the location of the holding-down flange, which is several inches above the mouth of the cylinder, and the unique method of manufacture evolved by the Ford Company. The output is now approximately 1,700 cylinder forgings per day.

Camshaft and Valve Mechanism Above Cylinder Heads—The design of the above is based on the Mercedes, but was improved for automatic lubrication without wasting oil by the Packard Motor Car Company.

Camshaft Drive—The camshaft drive was copied almost entirely from the Hall-Scott motor; in fact several of the gears used in the first sample engines were supplied by the Hall-Scott Motor Car Company. This type of drive is used by Mercedes, Hispano-Suiza, and others.

Angle Between Cylinders—In the Liberty the included angle between the cylinders is 45 degrees; in all other existing 12-cylinder engines it is 60 degrees. This feature is new with the Liberty engine, and was adopted for the purpose of bringing each row of cylinders nearer the vertical and closer together, so as to save width and head resistance. By the narrow angle greater strength is given to the crankcase and vibration is reduced.

Electric Generator and Ignition—A Delco ignition system is used. It was especially designed for the Liberty engine to save weight and to meet the special conditions due to firing 12 cylinders with an included angle of 45 degrees.

Pistons—The pistons of the Liberty engine are of Hall-Scott design.

Connecting Rods—Forked or straddle-type connecting rods, first used on the French DeDion car and the Cadillac motor car in this country, are used.

Crankshaft—Crankshaft design followed the standard 12-cylinder practice, except as to oiling. Crankcase follows standard practice. The 45-degree angle and the flange location on the cylinders made possible a very strong box section.

Lubrication—The first system of lubrication followed the German practice of using one pump to keep the crankcase empty, delivering into an outside reservoir, and another pump to force oil under pressure to the main crankshaft bearings. This lubrication system also followed the German practice in allowing the overflow in the main bearings to travel out the face of the crank cheeks to a scupper which collected this excess for crankpin lubrication. This is very economical in the use of oil and is still the German standard practice.

The present system is similar to the first practice, except that the oil, while under pressure, is not only fed to main bearings but through holes inside the crank cheeks to crankpins, instead of feeding these crankpins through scuppers. The difference between the two oiling systems consists of carrying oil for the crankpins through a hole inside the crank cheek instead of up the outside face of the crank cheek.

Propeller Hub—The Hall-Scott propeller-hub design was adapted to the power of the Liberty engine.

Water Pump—The Packard type of water pump was adapted to the Liberty.

Carburetor—A carburetor was developed by the Zenith Company for the Liberty Engine.

Bore and Stroke—The bore and stroke of the Liberty engine is 5 by 7 inches, the same as the Hall-Scott A-5 and A-7 engines, and as in the Hall-Scott 12-cylinder engine.

Remarks—The idea of developing Liberty engines of 4, 6, 8 and 12 cylinders with the above characteristics was first thought of about May 25, 1917. The idea was developed in conference with representatives of the British and French missions, May 28 to June 1, and was submitted in the form of sketches at a joint meeting of the Aircraft (Production) Board and the Joint Army and Navy Technical Board, June 4. The first sample was an 8-cylinder model, delivered to the Bureau of Standards, July 3, 1917. The 8-cylinder model, however, was never put into production, as advices from France indicated that demands for increased power should make the 8-cylinder model obsolete before it could be produced.

Work was then concentrated on the 12-cylinder engine, and one of the experimental engines passed the 50-hour test August 25, 1917.

After the preliminary drawings were made, engineers from the leading engine builders were brought to the Bureau of Standards, where they inspected the new designs and made suggestions, most of which were incorporated in the final design. At the same time expert production men were making suggestions that would facilitate production.

The Liberty 12-cylinder engine passed the 50-hour test, showing, as the official report of August 25, 1917, records, "that the fundamental construction is such that very satisfactory service with a long life and high order of efficiency will be given by this power plant, and that the design has passed from the experimental stage into the field of proven engines."

How the Vickers Co. Have Turned Out War Material

Makers of a Great Variety of War Material—Secrecy of Methods in the Old Land is Giving Way to Well Placed and Directed Publicity by the Authorities

IN the earlier part of the war considerable secrecy was insisted on by the various governments respecting the activity of the numerous industries contributing to the war effort. As developments proceeded apace it latterly became apparent that much benefit in the way of moral support and stimulation of output would result from judicious publicity regarding some of the spectacular and novel features of the situation.

One of the most pleasing features has been the constant frequency with which the King and Queen have visited numerous factories, mills, mines and explosives works throughout England and Scotland, resulting indirectly in much public interest in the plants visited. As a result of such events a number of photographs were recently published by "Engineering," of London, Eng., showing some departments of national and privately-owned establishments which had been visited by their Majesties.

FIG. 1—ONE OF THE FIFTEEN BAYS AT THE NEW HOWITZER SHOP OF THE VICKERS' COMPANY IN ENGLAND.

Howitzer Production

The well-known Vickers' concern

FIG. 5—VIEW OF ONE OF EIGHT BAYS OF A LARGE SHELL SHOP FIVE MONTHS AFTER THE SITE WAS OCCUPIED.

FIG. 6—FORGING 9.2 IN. SHELLS IN A BRITISH NATIONAL PROJECTILE FACTORY.

FIG. 7—WOMEN PRESSING BANDS ON 9.2 IN. SHELLS IN A BRITISH NATIONAL PROJECTILE FACTORY.

occupies a prominent place in the munitions world and a view of an entirely new howitzer shop at one of their establishments is shown in Fig. 1, while representative howitzers built there are shown in Figs. 2, and 4.

The building of this howitzer shop was commenced in August, 1915, the site being a private wooded park, and the building, which is admirably designed and completed in a thoroughly permanent character, has an area of 172,000 sq. ft., made up of 15 bays, all of uniform dimensions and equipped with specially designed plant and machines for the manufacture of the various units of howitzers.

When construction was started the firm guaranteed a certain monthly output in August, 1916, but the building was so quickly erected and the plant installed that the original output was exceeded within nine months of the site being taken over by the builders. Since then a considerable part of the field and howitzer equipment of the British army has originated in this shop.

Much of the important work, even in this department, is carried out by women machine workers under the supervision of male trained experts, who by this broad-minded action are performing a loyal service to their country. A certain small proportion of the men, however, take a narrow view on the question of labor dilution and endeavor to support their views by aggressive action.

It is not permitted to enter into detail regarding the design of the weapons produced, but the views shown are largely self-explanatory.

A Prominent Plant

Illustration Fig. 6 shows the interior of one of eight bays of a large shell shop which was erected by the Vickers' firm immediately after the outbreak of war. Commencing the foundation work in October, 1914, the plant had a considerable output of large-size shell in the spring of 1915. Fig. 6 was taken five months after the site was occupied.

The eight bays are each 60 ft. wide and from 400 to 475 ft. in length, and include a gallery 270 ft. long where the smaller shells are manufactured entirely by female labor.

A feature of the work done at this plant was the remarkable variety of shells turned out. This statement is not made in disparagement of highly specialized plants, but was due to the fact that the company, having a completely experienced staff prior to the war, was able to give, for the benefit of new-coming firms, the nucleus of new shell-manufacturing staffs, and in this way their indirect services were of as much influence as the direct production of shells.

National Projectile Factories

Figs. 6 and 7 are two views in a National projectile factory. The plant illustrated was commenced in September, 1915, and delivered the first shell in the following March. There are 20 bays of similar construction ranging in length from 600 ft. to 925 ft., and in width from 50 ft. to 38 ft. The total area of the plant is 37¼ acres, of which 12¾ acres are covered by buildings.

A self-contained power plant had to be provided of 6,000 horse power to provide hydraulic power for the forging presses, electricity for light and power, and compressed air for the pneumatic tools. Owing to the predominance of women workers every machine tool is fitted with a crane to reduce fatigue of operation to the lowest point. A very complete system of transportation is installed, while the trackage of industrial railway throughout the shops exceeds three miles.

National shell-filling factories followed as a natural sequence and the Vickers. Co. participated in this work largely. The plant referred to has a total area of 400 acres, the buildings alone covering over 1,000,000 sq. ft. Within the works are 11 miles of railway, while 3½ miles of timber runways were constructed to obviate the necessity of the workers going across open ground and running the risk of entering buildings with grit on their boots.

FIG. 3—6 IN. BRITISH HOWITZER.

Germans Are Ignorant of What Is Happening

Captain Len Morrison Spent Two Years in a German Prison Camp —Says Civilian Population is Suffering From Lack of Necessities —In France Early in 1915

THE following details of the treatment accorded to prisoners in Germany given to CANADIAN MACHINERY by Captain Len Morrison of Toronto, who was repatriated and arrived home last week, does not improve one's appreciation of German kultur. Captain Morrison as an officer received much better treatment than is accorded hundreds of thousands of other prisoners, and while he did not see how these other men were used he heard many accounts of almost unbelievable cruelty. Captain Morrison is a son of James Morrison of the Jas. Morrison Brass Mfg. Co., Ltd., of Toronto.

He was in England taking part in the shooting at Bisley when war was declared and at once made application to enlist for active service. He was advised by the British authorities to return to Canada at once and join his own regiment, the 10th Royal Grenadiers. He at once cabled his services to Col. Brock, the O. C. of the Grenadiers, and soon after arriving in Canada was sent to Valcartier and from there to England.

Hit at Ypres

He was sent to France early in February of 1915 and at the second battle of Ypres, in which the Canadians lost so heavily, was sent up to the firing line in charge of reinforcements for the 13th Battalion. Owing to conditions he was unable to connect with that unit and while battling with the Germans in a trench into which he had ordered his men, was struck by a machine gun bullet in the right leg just above the knee. A compound fracture resulted and the bullet passed on and injured the left leg also.

While Captain Morrison was having his injury dressed by a soldier the man looked up and saw the Germans coming and at once took to his heels. Just about this time the British artillery opened a heavy fire on the advancing Germans. Captain Morrison was caught in this and was frequently covered by the dirt thrown up when shells burst, but escaped serious injury. He dragged himself along, slowly and painfully, until he found a more sheltered place and then, after fixing up his wounds as best he could, waited. It was 36 hours before he was picked up by a party of Germans.

CAPTAIN LEN MORRISON

Saxons All Right

"I was fortunate at first in falling into the hands of Saxons," said Captain Morrison. "The Bavarian troops are very rough and the Prussians even worse. When I saw the party coming I just shut my eyes and waited for the worst, not knowing into whose hands I was going to fall. The men, although they were in a hurry, treated me kindly enough and carried me to a sheltered spot and after putting a rubber sheet under me, put another one over me and a greatcoat on top of that and left me. It was a good thing they had fixed me up as it commenced to rain and came down pretty heavy nearly all night. Next morning one of the Saxons, a young private, gave me his own ration of coffee and bread. I gave him some cigarettes. Soon after a medical officer came and my wounds were attended to and I was sent to a rail head. Here I was placed in charge of a young officer who could speak excellent English. He told me he had been in New York when the war started, and when I told him I was from Toronto he said he had been there.

Gloated Over It

"Soon after the officer had left me and while I was waiting to be lifted on the train, I had my first experience of German kultur. I was quite helpless as far as my legs were concerned and a German soldier who had been watching me came over and kicked my leg as hard as he could. Fortunately he kicked the left leg, which was not fractured. In order to deceive him I made

FIG. 2—9.2 IN. HOWITZER ON SIEGE MOUNTING.

FIG. 4—9.2 IN. FIELD HOWITZER.

a face as though he had hurt me badly and he went away in great glee."

Captain Morrison was taken to the hospital at Ghent, where he spent six months and was well treated. As soon as he was able to get around he was transferred to the Craefeld Prison Camp, in Westphalia. This is only eighteen miles from the Holland border and as attempts to escape are made almost every night the discipline is severe. There were 1,200 prisoners there when Captain Morrison arrived, of whom 300 were British officers. One of the first things he noticed was the manner in which the German military authorities keep the people in the dark as to what is happening in the outside world. The prisoners were permitted to have the German newspapers and translations of the news was made by officers who were able to read German. The news was obviously all carefully gone through before it was allowed to be published and everything that was in the nature of a German success was made the most of while reverses of any kind were not mentioned.

People in the Dark

"The whole policy," said Captain Morrison, "is to keep the people in ignorance of what is happening. They were fed up on tales of the prodigious successes of the German armies."

One of the plans of the military authorities is to keep the prisoners moving. Captain Morrison was not kept at any of the prison camps for any length of time. The reason probably is that when the men become familiar with their surroundings they have a better chance to escape. The worst prison camps in Germany are in Hanover, and it was to one of these that Captain Morrison was soon sent.

"We were given such short notice that we were to be moved," he said, "that many had to leave without even a chance to get together their belongings. Many of the officers under the impression that they might stay at Craefeld for some little time had from their own private funds fixed up their quarters by having them repapered and additional furniture moved in. They were rather rudely surprised at being given no chance to even get things they needed. We were simply rounded up into parties and told we were to be moved and had to wait until the authorities were ready to move us, which wasn't long. From Craefeld I was taken to Schwarmstedt, and after a couple of weeks there was taken to Holzminden. Both these camps are in Hanover. The sand which surrounds the quarters is full of fleas and the sanitary arrangements were very bad. The beds were full of vermin and the heat was something terrific. While we were allowed to make protests regarding conditions absolutely no notice was taken of them. We had to do our own washing and cooking with the scantiest of appliances. Many of the men suffered greatly and there was a great deal of sickness. One of the common things which results from being kept in a German prison camp very long is loss of memory. Up to this time we had been able to get a fair variety of food, but it was not long before conditions in Germany began to be felt in our camps. At Holzminden each morning we were given coffee made out of acorns and unpalatable stuff. At noon and in the evening we each got a bowl of soup which was made from some kind of weeds and was anything but inviting. These camps are known as strafe or punishment camps and they certainly are well named."

Some More Kultur

At Holzminden the camp commandant was Captain Neimyer and his one mission in life, according to Captain Morrison is to go around and make things miserable for the prisoners.

"Nothing would satisfy him," said Captain Morrison; "his one idea was to roam around looking for trouble. The heat was terrific but he decided that it would be most unwise to allow the windows to be open at nights. The mattresses on which we had to sleep were very dirty, so between Captain Neimyer, the hot weather, poor food, the fleas and other troubles we suffered considerably. This, of course, pleased the captain. We had to take our bath in the horse trough and had no soap.

"People in this country who think the war has affected them have no idea at all of what the people in Germany are enduring. Everything is being sacrificed for the needs of the army. There is such a scarcity of leather that the majority of civilians now wear either wooden shoes or shoes with a flexible steel sole. Clothing is very scarce and high priced. Food is the worst, though. The Germans who are not fighting fare very badly. Our sentries were generally old men unfitted for active service and I have often seen them go to the garbage piles in the camps and endeavor to scrape out from tins which had reached us through the Red Cross little scraps of fats or grease. Not infrequently loaves of bread which had been sent to us would reach us in a blue, mouldy condition from delays in transmission. It was unfit for us to eat and when we threw it away the loaves would be eagerly taken by these men. "While we were not allowed to mingle with the civilians, we could judge of conditions from the walks we were permitted to take on giving our parole not to attempt to escape. There was unmistakable evidence in the pinched faces of the people, their tattered clothes, the wan and sickly looks of the women and children that they were being deprived of the essentials of life.

"It is this sort of thing that is weakening the courage of the German people. When they find out what they have been compelled to suffer and how they have been misled by the militarists there will be a great reckoning."

From Holzminden Captain Morrison was sent to Heidelberg and on account of his physical condition arrangements were made to send him to Switzerland. With 90 others he left Heidelberg at 3 o'clock in the morning and was taken across the border. From then on all was smooth sailing and he was sent from there to England and from there home.

"GARABED" THEORY IS SHOT TO PIECES

Commission Don't Give Him Any Encouragement Following His Demonstration

A matter that was attracting considerable attention by engineers and scientists has been settled. A representative body of men representative of the best that United States has in the way of research and technical knowledge, have decided that the "Garabed" principle is not sound. The finding they have handed out is put in very lenient words.

For a time after the tests were made there was a bit of hope that there might be a favorable report on the case, but that was entirely dissipated when the official report came out in the Official Bulletin published at Washington. The report does not give Mr. Giragossian much hope of further encouragement. Nothing has come out to show exactly on what principles he was working. In fact the secrecy in which he was working is carried out in the report issued by the Department of Interior. It could hardly say less and say anything at all.

Following is the official signed report:

We, the undersigned, who are members of the commission duly appointed in accordance with the provisions of public resolution No. 21, Sixty-fifth Congress, hereby certify that Mr. Garabed T. K. Giragossian showed us on Saturday, June 29, 1918, a model embodying the principles of his invention known as the "Garabed." We found that the model was not in shape to run or develop power. The inventor admitted that he had no working machine and that he was merely explaining principles. We do not believe that his principles are sound, that his device is operative, or that it can result in the practical development or utilization of free energy.

Witness our signatures at Boston, Mass., this 29th day of June, 1918.

James A. Moyer, director, Massachusetts State Board of Education.

Edward F. Miller, Massachusetts Institute of Technology.

M. de Kay Thompson, Massachusetts Institute of Technology.

Edwin B. Wilson, Massachusetts Institute of Technology.

Hamilton, Ont.—The E. T. Wright Co., of Hamilton are contemplating the erection of a 150 ft. by 56 ft., one story and basement addition, to their present factory. The building will be so constructed as to permit of further extension should occasion require.

Repeated Impact Test Gives the Best Results

Various Devices Have Been Brought Out to Secure Accurate Temperature Control — Dr. Stanton Has Done Some Valuable Work in This Connection—A Wide Field in Which to Experiment

CLOSELY connected with the question of heat treatment is the subject of mechanical tests upon the treated material. Attention has been recently directed to the very great importance

FIG. 4.

of such mechanical tests. It is not proposed here to enter deeply into the question of hardness tests, but experience suggests that the form of test most frequently used does not necessarily indicate what will be the resistance of the hardened surface to the abrasion to be met with in ordinary wear. In those tests which base the measurement upon the rebound of a weight from the hardened surface it appears possible that the mass of the hardened piece enters into the measurement, and it is suggested that figures attained in this manner should be regarded primarily as comparative between pieces of the same mass. Of course it is very clearly recognized that this comparative information is extremely valuable and these remarks are only made as a suggestion for further investigation.

A variety of tests are now made upon materials used in engineering work—for instance, tensile strength, elastic limit and yield point. There is also the single impact test, for instance, the izod test. It is found, however, that when you have all the data which these tests can give that there may exist large and critical differences between two materials, whose tests are apparently the same, when these materials are subjected to actual use in a piece of mechanism.

To discover such differences, the repeated impact test is extremely valuable. It is probably well known that Dr. Stanton devised a machine for making such repeated impact tests in 1908, and experiments with his machine have shown that extremely valuable information can be obtained by subjecting the material to a succession of shocks or impacts of a known amount, each shock being small individually, but the cumulative effect resulting in the breakage of the sample.

In the various forms in which this repeated impact testing has been worked out certain disadvantages were found with regard to the detail arrangement of the mehcanism. For instance, in one form it was found that the energy of the blow was not strictly calculable because it was uncertain how much mass was operating. The hammer which delivered the blow was attached by a lever, and it was impossible to calculate exactly how much of this lever entered into the effective mass of the hammer. It was further found that the nature of the surface upon which the machine was mounted influenced to a large extent the resulting figures.

Repeated Impact Testing Machine

To get over these difficulties, Mr. C. G. Eden worked out a design of repeated impact machine, and in conjunction with him I have developed the machine illustrated in Fig. 4. The hammer is without attachments, and falls freely under the influence of gravity, the whole falling mass of the hammer is symmetrically disposed above the point of impact, and the actual height of the fall may be measured easily, so that the true energy of the blows is calculable to a high degree of accuracy.

The base, which supports the test-piece, is massive and rigid; it will therefore experience only a negligible movement or deflection during the time in which the falling hammer delivers its blow. For this reason it is immaterial to the results attained whether the machine be mounted on a concrete floor or a wooden bench.

To demonstrate this feature of the design, the tests tabulated below were made under extreme conditions. In the first two tests, marked "rigid," the machine was firmly bolted down on a concrete floor, while in the remaining two, marked "floating," the machine was loosely supported upon a bed of folded canvas strips five inches wide, set up on edge. This last condition was the most non-rigid mounting that could be contrived. The material tested was an alloy steel, the samples being cut from the bar as it came from the mill and not subjected to any heat treatment. It will be seen that, notwithstanding the extreme conditions of mounting, the results are in very fair agreement.

Sample No.	Condition of Machine	Number of Impact Blows	Dep. from mean (1138 blows)	
1	Rigid	1104	— 34	— 3.0%
2	Rigid	1120	— 18	— 1.6%
3	Floating	1186	+ 48	+ 4.2%
4	Floating	1142	+ 4	+ 0.4%

The illustration in Fig. 4 gives a general idea of the external appearance of the machine. The whole of the mechanism is secured to and supported by the main casting, which also acts as a cover to the tank or box casting. Projecting through the side of the tank, but not seen in the ilustration, is the main spindle. This may be driven by a 1-in. belt from any convenient countershaft, or alternatively by an electric motor

FIG. 4.

with suitable gear or worm reduction. The power required is about one-tenth horse-power.

Mechanism

The main spindle carries a dog clutch normally in engagement and driving a cam. A roller bears on the upper surface of the cam and is attached to the lower end of the rod H. It is so guided that it rises and descends at each rotation of the cam. Fixed on the rod H is an arm J, which engages with the lower face of the hamer M, thus when the rod H rises, by rotation of the cam, the hammer M is also lifted. The hammer slides freely between two sets of three-point guiding screws, these screws being carried by the two castings seen attached to the standard G and its fellow on the opposite side.

Mounted upon the standard G is a sleeve W, free to rotate about the standard but normally held in a fixed position by the spring L. Clamped on the sleeve W is an adjustable catch K. As soon as the arm J has lifted the hammer M sufficiently, the spring L causes a partial rotation of the sleeve W, so that when the arm J descends, the hammer is held by the catch K. The lower inclined face in engagement with the roller arm N, attached to the sleeve further descent of the arm J brings its W. in such a manner that the catch K releases the hammer M, allowing it to fall upon the test-piece O.

The test-piece, the size and details of which are further discussed below, is carried by two hardened steel bushes in the plummer blocks PP. It is rotated through 180 deg. between successive blows. One end of the sample is slotted to engage with a universal joint drive, and is kept in engagement by a screw R. The universal joint is driven through a free wheel and clutch T by the chain S. One end of the chain is attached to the roller bearing on the cam already described, and the other end carries a weight suitably guided; the rotation of the test-piece begins and ends entirely between the successive blows.

The revolutions of the test-piece are recorded by a counter V, and of course, the number of blows is found by multiplying the counter record by two. When the test-piece breaks it comes in contact with an arm X, and thereby trips the clutch and stops the machine. The tank is partially filled with oil to provide efficient lubrication of the cam and other surfaces.

The hammer is shod with a tup of hardened tool steel. The height of the drop depends on the position of the adjustable catch K on the sleeve W, and may be varied from one to four and a half inches (25 to 113 m/m). To allow a wide range of tests, two hammers are provided, weighing 5 lbs. and 2 lbs. (2.26 and 0.91 kilos) strength.

Using the 5 lbs. hammer, the main spindle may be driven at any speed up to about 60 revolutions, or with the 2 lbs. hammer up to about 90 revolutions per minute, giving 60 and 90 blows per minute respectively.

Test Pieces

The machine is adapted for test-pieces of dimensions similar to those adopted by Dr. Stanton; these are illustrated in the upper diagram in Fig. 2. It will be seen that a V notch is cut in the region of impact to localise the stresses. The angle at the bottom is 90°, and is made as sharp as possible. As an alternative, a semicircular groove, as shown in the middle diagram of Fig. 5 may be used, and such a groove appears to offer several practical advantages over the V groove. Referring to the upper diagram in Fig. 2, it may be assumed that the action of the hammer, when it falls upon the test-piece, is to produce a very slight but sudden bending at the section of smallest diameter, that is, at the bottom of the groove, as indicated diagrammatically in Fig. 3. This will produce an area of compression at "A," and will tend to start slipping between the crystals, due to tension, at "B." Of course the process is reversed at the next blow because the test-piece has been turned through 180° in the meantime.

It will be admitted that it is quite impossible to turn a groove having a true

FIG. 5.

geometric angle, there must be some minute curve at the bottom of the groove. The size of this curve will determine the axial extent of the regions of compressive and tensile stresses. Since this size is in any case very small with a nominally sharp V, it is obvious that the variation between the size of curve in different test-pieces will be relatively large and will tend to introduce an element of uncertainty into the test results. It may be argued, in addition, that since no capable engineer would design a machine with a sharp re-entrant angle the conditions of test are largely artificial.

Another shape of sample has been proposed, as shown in the lower diagram of Fig. 2, having a relatively large portion of reduced diameter, but this is not advised. The end of the tup of the hammer, being a plane surface, will bear upon the test-piece over a considerable length parallel to the axis of the test-piece, and it is probable that, owing to the minute bending of the sample, the local stresses at the ends of the area of contact are greater than at the plane equi-distant between the points of support—in fact, it has been found with test-pieces of this shape fracture will begin at the point coinciding with the end of the area of contact between the tup and the test-piece. There is a further disadvantage that the action of the blow will distort the cross section of the material at the plane of fracture.

The semi-circular groove, as shown in the middle diagram in Fig. 2, is free from the disadvantages of both of the other types. It serves to locate the plane of fracture sufficiently closely, the effective diameter at the bottom of the groove is measured easily, any small departure from the nominal curvature is without practical effect upon the results and the actual area of fracture is not distorted by the hammer blows. Re-entrant angles are frequently designed in machines with a fillet of such radius, therefore the results have a more direct bearing on actual engineering practice.

The following tests were made to investigate the effect of the shape of the groove. The material was a commercial mild steel, annealed by heating to 900° C. and cooling in the furnace. The tests, as a whole, demonstrate the relatively unreliable nature of commercial mild steel. They show clearly, however, the greater approach to uniformity with the semi-circular groove, they also show the small influence of large variations in the curvature of the groove.

Sample No.	Diam. at bottom of groove. inches	Shape of Groove.	Radius of Grove. inches	Number of Imp. Blows
3	0.400	Sharp "V"	——	8
4	0.400	Sharp "V"	——	188
5	0.400	Sharp "V"	——	260
6	0.400	Sharp "V"	——	70
7	0.400	Semi-circular	0.06	548
8	0.400	Semi-circular	0.06	590
9	0.400	Semi-circular	0.04	410
10	0.400	Semi-circular	0.04	484

As an indication of the valuable information to be obtained with this repeated impact machine, the summary of tests in the table below is interesting.

Mater.	Izod Impact Ft. lbs.			Eden-Foster Repeated Impact No. of Blows.		
	Max.	Min.	Mean	Max.	Min.	Mean
A	104.7	90.7	97.7	584	458	521
B	71.7	45.0	58.4	1478	782	1140

These results show that the "Izod" test does not, by itself, give a reliable indication of the dynamic respectively.

MAY TRANSFER ROYAL NAVAL COLLEGE

THAT the decision has been practically reached to transfer the Royal Naval College from Kingston, Ont., to Esquimalt, B.C., is the announcement made recently through the offices of the capt.-supt. of the Esquimalt dockyard. The naval college, which was removed to temporary quarters at Kingston following the disaster last December, is to be transferred here temporarily, pending the erection of new college buildings at Halifax. It was announced that the naval students will be accommodated in one of the large buildings available in the Esquimalt dock yards, which can easily be converted for the purpose. It is understood that the naval students will be installed at Esquimalt by August.

Method of Estimating Cost of Machine Work

The Manufacturer Cannot Continue to Stay in Business and Estimate Too Low—Some of the Irregularities That Come Into the Question of Figuring on Jobs For the Trade

By DONALD A. HAMPSON, ASSOC. MEM. A.S.M.E.

UNDER this heading a construction engineer relates his experience in getting bids on some castings and machine work. The work was for replacement on some hydraulic equipment for a large city; bids were asked from a dozen shops, nine of which quoted their hourly rates and the other three quoted prices of $750, $1,020 and $1,890. Evidently the wide variance in these three latter rather peeved the engineer for he goes on to say . . . "cannot take a drawing and make an estimate from it" . . . "when a job is taken to a contract shop, expect to be overcharged as a matter of course," . . . "small manufacturers with their inefficient methods," etc. Such remarks ought not to go unchallenged, and having been in the despised small manufacturer class I will present some of the points from the other side.

Afraid of Fair Price

It is an undeniable fact that many manufacturers and many machinists are unable to estimate the cost of a given piece of work; it is also true that many manufacturers (small ones only) are afraid to ask a fair price for their work in advance and to add a margin for safety to cover those little necessary uncertainties and losses which are reasonably sure to crop up. Without a doubt, the nine replies that named no price came from shops in this class, and it must be said from their standpoint that they were justified in quoting only hourly rates, while the shops themselves may have been run efficiently and the management been entirely honest.

The three bids of $750, $1,020 and $1,890 likewise may have been made with all honesty, the $1,020 bid probably representing a fair average price and the others extremes either way. It is easily probable that the difference in prices has come from different shop equipment and methods and different market prices for labor and materials in different localities. Such being the case, each shop bid a fair price and is justified in sticking to it. It is safe to assume that the fees of consulting engineers vary fully as much—yet the man with a Broadway suite is fully as honest and as capable as his struggling brother in the north-west whose bid is fifty per cent. less.

In the case that we are considering a complaint was made about the slowness with which the bids came in. It is easy to settle that and the answer sheds some light on the widely different prices, too. Many, many drawings do not state the limits which the machinist and the estimator must know, which denotes certain finishes and fits, and which are supplied with all the notes that any man, other than a mind reader, should have before an intelligent estimate can be made. Such shortcomings are to be expected on the drawings of inventors and laymen, but the work of engineering departments is open to criticism at times also as witness the following.

And in Three Days!

The largest steel and machinery firm in the U.S., outside of several trusts, found its plants overtaxed and decided to put several of its products out on contract. Our shop asked for a chance to bid on some of the work, and received a fifty pound roll of prints and a letter stating that "we must have your estimate in three days." The work amounted to a hundred thousand dollars, and could be spread out over seven months —the estimate though must be hustled. Imagine our surprise when an examination of the prints showed sixteen letters denoting sixteen different finishes, but no key to the finishes being shown on the prints. Hence we knew no limits and finishes except by guesswork. Further, steels and bronzes of special analyses were required, standard bolt and nuts were carefully detailed—presumably to be made up, though a dozen machine screw manufacturers kept them in stock—and even locks that could be found in hardware catalogues were detailed. What kind of an estimate could be made on such information? Only a few weeks ago an engineer asked us for a figure on forty-eight 15 in. cylinders, and his drawings failed to show a finish on the outside, which would add forty per cent. to the labor (a finish that we guessed he wanted, and that he really did).

All of which is not intended as a knock, but just to show that "much might be said on both sides," and that a spirit of tolerance and co-operation is of mutual advantage. I should have liked a chance to bid on the drawings which raised the question, but I contend that because my price was higher or lower than the others or the engineer's guess, it would not mean that any of us was wrong.

No Standard of Prices

There is such a thing as a fixed standard of accuracy which is good the world over, but no standard of prices, yet on work which is not made in quantities, two men on the same block might make widely different estimates, and both of them be correct for their own shop. It's all a matter of equipment and ingenuity on these jobs of a few pieces, modified by the local scale for commodities—cost systems and efficiency methods here count for but little if the shop force is well directed. System and the proper tools and large quantities will make the cost per piece the same in the East as in the West—but that's another game.

That first class shops "slip up" on this estimating problem may be proven by two instances. An Ohio manufacturer whose equipment and men have always been the best that money could get, and whose line was as near to shell work as any could be outside of the military field recently gave a talk before an engineering body, relating their experience on a shell contract in 1915, how their estimates were far too low, their deliveries six months behind, and unlooked for troubles all along the way. If first class men with every facility can't estimate duplicate work in big quantities is it fair to brand as inefficient small manufacturers who incorrectly estimate the time on a single piece? Another, an Eastern machine tool plant took on some contract work for an automobile concern. Both firms have a nation-wide reputation for good work, one in the small lathe field and the other in the $5,000 car field. The machine tool firm lost nearly 50 per cent. on their contract, presumably because they, too, "cannot take a drawing and estimate from it."

Defends the Machine Shop

There are many machinists that will resent the slur on contract and jobbing shops and their charges. Granted that there are unscrupulous men in the machine business as in every other, that there are city shops running in cellars that never see the light of day, and country shops doing business in converted barns with a junk pile supporting one outside wall (this combination known as the "foundry"), yet the majority of city and country shops are honestly run, and rank far above establishments in the building trades which do not come in for such slurs. One marked difference between the machine and building trades is that the former work the longer hours, under stricter supervision, must deliver of a skill and intelligence of a high order, and the shop and men get less per hour than in a branch where the entire "trade" can be learned in a month. The employer in the former case has to provide equipment of the most expensive and extensive kind, has to figure a job down to the last five cents, and is subjected to a multitude of useless factory laws that tempt him to sell out and put his money in the savings bank.

Yet, because the contract shop charges for the time it took to collect and put away tools and blocking, for the set-up on a single job, and for the six hours setting up as well as the two hours that it took for the actual cut, it is over-

charging. I have had a man contend that, because he was charged the same for a cut .005 in. deep a for one ⅛ in. deep, he was overcharged, his contention being that the work was so much less in the one case.

Can't Figure Too Low

The facts in the matter are these: any small manufacturer is in business to stay if he can and he will meet his customers half way both in charges and estimates, but he cannot continue to figure too low and stay in business. Maybe the equipment of one shop is such that it can do boring to better advantage than any other kind of work, but the shop will take other work as it comes along and charge the usual rates for it by the hour, it cannot be expected to do this other work for the same price as a specialist in that particular line. The proprietor is honest and so is his loyal gang of men who work more minutes to the hour than any plumber who ever came down the pike, but to live they must at least break even on their work. I have had a painter complain about the brushes he had to buy for his men; his equipment ended with brushes and ladders, mine began with machine tools and high-speed steel and drills (and included brushes as a minor item) and yet in our locality working painters got 20 cents more an hour than machinists and charges for work were in proportion. If the small manufacturer got a little more of the $1 to $2 an hour work he wouldn't remain a small manufacturer long. Doctors and lawyers are entitled to their fees whether they win or lose —why should not machine shops get a fair price when they have to win to collect at all?

ECONOMIC STEP BY ENGINEERS

The Canadian Engineering Standards Committee, constituted with official representation from the departments of the government, the Canadian Manufacturers' Association and the important technichal organizations, has been formed in Montreal, and will be of paramount importance in economic production in Canada. It will also have the effect of harmonizing British and American practice. Its primary objects are to secure interchangeability of parts, to cheapen manufacture by the elimination of waste entailed in producing a multiplicity of designs for one and the same purpose, to effect improvement in workmanship and design, and by concentration rather than by diffusion of effort to expedite delivery and reduce maintenance charges and storage.

At the organization meeting Sir John Kennedy, the dean of the engineering profession in Canada was unanimously appointed chairma, and P. H. Vaughan and Capt. R. J. Durley vice-chairmen. Dr. John Bonsall Porter was elected honorary secretary-treasurer, and Frank S. Keith, secretary. The headquarters of the organization will be at the Engineering Institute Building, 176 Mansfield street, Montreal.

THE INDIVIDUAL DRIVE BECOMING MORE POPULAR IN ENGLISH SHOPS

By P. E. R.

Individual motor drive for metal working tools is becoming standard practice and it is interesting to note some of the applications of electric drive as developed in England.

The drawing Fig. 1 shows a curve of a machine arranged for self-contained electric drive, single speed, through gearing and motor mounted on top of the machine. A strong cast iron framework is attached across the machine standards, and the whole driving gear is mounted on planed faces on this casting. A compound wound motor of 35 b. h. p. with starter is used to drive a 5-foot square machine to run at approximately 600 revolutions per minute.

The two gear wheels run in an enclosed oil bath and the two shafts are supported in self-oiling bearings, with provision for returning oil running out of same to the reservoir. The quick return of the table is operated by the motor shaft extension, so that the gears do actual work during the cutting stroke only. It will be noted that no crossed belt is necessary.

Fig. 2 shows a 5-foot square planing machine, fitted with an English electric planer equipment, while illustration Fig. 3 shows a 4-foot square planing machine to plane 10 feet long, fitted with a special four-speed countershaft, self contained electric drive, the motor being directly coupled to quick return shaft. The size of motor used with this machine is 20 b. h. p. compound wound, and runs at approximately 400 revolutions per minute.

It is said to be possible with this drive to obtain cutting speeds of approximately 30, 40, 50 and 60 feet per minute with a constant return speed of 90-100 feet per minute. All the bearings in this machine are self-oiling. Each turn of the hand wheel shown on the photograph gives a different cutting speed without stopping the machine. There is no unnecessary friction and no claw clutches. There are no sliding gears to break and no noisy gears, nor leaky gear boxes to drop oil on to work before the finishing cut is taken.

The accompanying curves Figs. 4 and 5 were taken with a Lancashire electric drive ,which is said to be economical in power and has a perfect regenerative and cushioning effect at reversal. On a belt-driven planer the reversal of the pulleys and the consequent slipping of the belt causes a large amount of power to be wasted at each reversal This waste becomes larger as the stroke is decreased.

In order to prove this the following tests have been taken on the two rack driven planers (1) A 5 ft. 6 in x 3 ft. 6 in. x 12 ft. planer was arranged with motor belt drive and three flywheels for reducing the peak and assisting the reversal. (2) A 4 ft. x 4 ft. x 12 ft. planer was equipped with a "Lancashire" drive and in both cases the cutting speed was 50 ft. per minute and return speed 150 ft. per minute. The load on the bed slides in each test was 4 tons.

The test was made with a watt hour meter and the curves show the total power taken from the mains in both cases with various strokes. In the above tests the electrical machines were only partially loaded as the planers were not cutting, therefore under ordinary working conditions the efficiency of the "Lancashire" drive as compared with the belt drive would be still more pronounced.

THE MANUFACTURE OF TACKS

THE majority of users of the humble tack have no conception as to the amount of work involved in its production or the number of processes that are necessary to produce this common but very important article. To look at a tack one would hardly believe that so much expenditure of labor and skill was necessary in its manufacture, but in reality such is the case. The fact that tacks are manufactured in large quantities on a high-production basis enables the manufacturer to operate his plant profitably in spite of the low cost to the consumer. The amount of profit depends to a large extent upon the layout of the plant and methods employed. These methods, while being very similar in most plants vary in certain particulars which may be termed trade secrets. Most tack manufacturers have methods of their own which are carefully guarded and which are claimed to affect considerably the earning capacity of the plant and the quality of the product, both very important factors in these days of keen competition.

The tack plant which the Steel Company of Canada, Ltd., operates at its Canada works, Hamilton, Ont., is run on a highly efficient and profitable basis.

The company furthermore has this advantage that it rolls its own sheets or tack plate, to use the trade term, and is thus assured both as to even quality and regular supply of the raw material. The tack plate which is rolled at the company's principal plant at Hamilton is made in certain definite sizes and in gauges ranging from 21 to 10, the size and gauge varying according to the size of tack to be made from the sheet. The sheets are delivered to the Canada works in bundles and are stored there until required.

Pickling and Baking

The sheets at this stage carry a certain amount of scale which must be removed. This is done in the pickling process. The sheets are laid in racks, end up, and dipped in tubs containing vitriol, a fairly strong solution of sulphuric acid, which removes the scale and makes the sheets bright and clean. The rack, with its load of sheets is then lifted out and placed in another tank containing lime, which removes the acid adhering to the sheets. The sheets then undergo a baking process which restores the material to its normal condition and neutralizes the effect which the acid has had on the physical properties of the steel. The baking is done in coke-fired ovens heated to a high temperature. After baking the sheets are ready to be converted into tacks in another department.

Test taken with Recording Ammeter.

FIG. 4.

Making the Tacks

The tack machines are arranged in long rows, the material being fed to the machines in the form of strips by boys who can take care of three or four machines each. At one end of this room is a power shear for shearing the sheets into strips of varying widths according to length of tacks into which they will be converted. For the same reason the gauges vary. The tacks are made from

FIG. 3—A 4-FT. ENGLISH SQUARE PLANING MACHINE WITH 4-SPEED COUNTERSHAFT AND SELF-CONTAINED ELECTRIC DRIVE.

⅛ in. to 1⅜ in. long, inclusive. The tack machine, which is rather a complicated piece of mechanism, operates at a high speed, accompanied by considerable noise as the process is more akin to stamping than anything else. The most important feature is the timing and adjustment of the tools in the machine. There are ten tools in each machine, and each tool must get to a given point and away again to allow the next tool to do its part of the work. Needless to say this requires very careful adjustment, particularly on account of the high speed and nearness of the tools to each other. The strips are placed on the machine by the operator and then are automatically fed with tools, the tacks falling into a pan underneath the machine.

Varieties of Tacks

Tacks are made in various finishes, bright, blued, galvanized, tinned, copper, brass or nickel-plated, coated and Japanned. Blued tacks are obtained by heating them in a blueing machine or heater. The bright tacks are first annealed and then passed through tumblers which gives them the bright finish desirable for certain purposes. The galvanized, tinned and plated tacks are treated by being dipped in the ordinary way.

Picking Process

The next operation is an important one, particularly as far as the consumer is concerned for the public demands perfect tacks. During the process of converting the steel strip into tacks there is a certain amount of unavoidable wastage, because the two ends of the strip being square will not make tacks. These ends come through with the good tacks and have to be eliminated in the picking process.

The picker is an inclined revolving screen, a different screen being used for each size of tacks. The defective work falls through the holes in the screen and the good tacks pass down inside and fall into a box at the bottom. The good tacks are then taken to the packing room and put up in bulk, 25 lb. and 50 lb. boxes, cartons, etc., according to the requirements of the customer. Before being packed the tacks are all weighed so that each box, carton or package contains the correct amount of tacks. The boxes, etc., are then stored until shipped.

The tacks are made in a large number of varieties and sizes for various trades. In many cases the form of the tack varies, but the process is the same. The form and size of the tools employed in the tack machines vary in proportion to the variety and sizes of tacks manufactured. For this reason a considerable amount of work is involved in making the tools for the machines and in keeping them in good working order. The tools must of necessity be correct in form otherwise unsatisfactory work would be the result.

Orangeville, Ont.—Dods Knitting Co. will erect a $40,000 extension to their plant.

MINING DISCOVERY MADE IN CANADA

The Forest Products Laboratories of the Forestry Branch of the Department of the Interior have found a substitute for pine oil, now in such demand for the reduction of ores by the oil-flotation process.

What the oil-flotation process means to the mining world is shown by the statement of a leading mining journal that a certain great mine, which formerly recovered 70 per cent. of the metal from its ores, was now, by this process, recovering 90 per cent.

To work this process there has been required up to the present pine oil extracted from the "hard" pine trees of the Southern States. The erection of oil-flotation plants all over the United States so increased the demand for pine oil that the price went rapidly bounding upward, and it seemed as if in a short time the supply coming across the line to Canadian plants would be entirely shut off.

Work Done by Canadians

Cobalt is one of the districts most concerned, and some of the aggressive operators there started experimenting in the way of trying to make for themselves a pine oil from Canadian stumps. While these experiments were not barren of results by any means, the miners quickly realized that this was the work, not of miners in small experimental plants, but of specialists in well-equipped laboratories. They therefore applied to the Minister of the Interior, who, having established about a year before the Forest Products Laboratories of the Forestry Branch for just such investigations, started the laboratories to work on the problem.

The work was done by Canadians. It achieved its twofold object. The chemists found that they could make pine oil from red pine stumps, such as may be seen any day on a trip on any of the railway lines running through the "pine plains" on which Camp Borden is situated. Had this been the only discovery it would mean that Canada would have had in this time of war to establish a new industry involving the collection of pine tree stumps over a large area and assembling them at one place for distillation. It is possible, but not likely, that such an industry may be established, as the amount of turpentine in the stumps of northern pine is limited, and pine oil is secured from turpentine by a second distillation.

Substitute Found

But the second object of the search was of still greater importance. It was discovered that one of the creosote oils, thrown off as a by-product of the hardwood distillation industry, would serve in the oil-flotation process equally well with pine oil. This by-product up to that time had so little market value that a good deal of it was burned for fuel. It is produced now at the rate of nearly twelve hundred gallons per day in Canada.

It seemed at first almost too good to be true that a comparatively waste product would take the place of the costly pine oil, but the new oil was thoroughly tested in the ore-dressing station of the mines branch, Ottawa, before public announcement was made. The result of this division of labor between the government and the miners is that the government chemists solved the scientific problem and the miners are now working out the practical application in their plants, with increase in economy and efficiency. The miners get a much cheaper material, and the wood distillation plants have now a market for another of the by-products of their industry. Both industries are naturally pleased with the result. It means also that money formerly sent abroad is kept at home to build Canadian industries.

WOULD REGAIN ONTARIO TRADE

British Columbia will reopen its Toronto lumber office. Some months ago L. B. Beale was recalled to Victoria and the office was closed because of war financial conditions. B. C. lumber interests have been conducting a very serious lobby to have this reopened, on the ground that all the good work done by the office has proved of great value to the B.C. lumber industry. The business connections created by the office went by the board when it was closed.

Just at present there is strong competition for Ontario business, of which the American lumbermen are getting the biggest share. The need for the resumption of an educational campaign to crease the use of B. C. lumbsr in Ontario has been forced upon the government of the far Western province, and an agitation was commenced recently to push the claims of the B.C. product in the Ontario field. It was felt that the demand in this province for Douglas fir and other timber from the coast was down to an irreducible minimum, and with the slump in wooden shipbuilding throughout all Canada this has caused a decision to expand the present markets.

Mr. Beale, who was formerly in charge of the Toronto office, has been appointed special lumber commissioner for British Columbia to Europe. He will seek to extend the market for British Columbia products in Great Britain, France and other countries. He will come East in the very near future, and will make a survey of conditions in Eastern Canada before departing for Europe.

Architects in Ontario have been extensive users of Georgia pine and other American woods for building purposes, and it was largely through Mr. Beale's work in the East that the British Columbia lumber began to win greater popularity. The Toronto office was closed at a time when B.C. lumbermen were too busy filling orders for outside territory to make use of the Ontario field to the best advantage.

The decision to institute another campaign is an important one to the building trades in Ontario, indicating that another Canadian industry is seeking to reestablish itself on a permanent basis after the unusual conditions occasioned by the war have to a large extent been altered.

METHOD AND TOOLS FOR MACHINING A SPLIT RING

By F. Scriber.

An interesting example of machining by the use of special tools is described and illustrated in this article. The part to be operated upon is the split ring shown in Fig. 1. This ring is machined from a bronze casting, the operation of splitting apart being the last that is performed upon it, with the exception of burring.

In handling this piece it is first gripped in a three-jawed chuck, the hole is bored and faced, it is next gripped by the inside diameter and the opposite side is faced, these portions being indicated by finished marks. The outside is unfinished with the exception of filing and that part of the work which is of particular interest consists of drilling the holes, spot facing and cutting apart. For the drilling and reaming operations we proceed to drill by using a jig such as is shown in Fig. 2. The holes to be drilled and reamed are four in number, A, B, C, and D, Fig. 2. The ring is placed in the jig in the manner shown locating from the hole on the stud E. When the work is placed on this stud the slip collar F is slid in place and the work is securely clamped into position by means of a hand knob G. For radial location around the centre of the large hole the boss X is forced against the head of the bushing H by means of the thumb screw J, these arrangements locate the part so that all work produced in this jig will be interchangeable, suitable bushings as is obvious being used for guiding the drills.

The next operation on this part is shown in Fig. 3. This consists of spot facing the bosses where indicated and a very simple tool is provided in this connection. This tool consists of an angle iron A in which are placed two pins B and C; one of these pins C is flatted off on the side so as to permit of slight variations in the centre distance of the work. The part is slipped on to these two pins in the manner shown and the surface X is spot faced. To spot face the surface Z it is only necessary to slip the work off the pins, turn it over half a revolution and slip it back on again. It is not necessary with this tool to provide any means for clamping the work. The angle iron is of course clamped down to the drill press and by using a regular counterbore with a teat on it this operation is readily performed.

Having now completed the machining on the ring it is split in half on the milling machine, using the fixture shown in Fig. 4. The ring is again located on two pins A and B, at this time it is clamped to the fixture by means of the two clamps C, the clamps being constructed in the usual manner with nuts and washers D used for clamping purposes. The spring E is for holding the clamp up while the work is being removed. A headless screw G with a check nut J on it is used under the heel of the clamp while the base of the fixture H is made of cast iron. This fixture has two tongues F which fit in the slots of the milling machine table, and a slot K is cut across the top of the fixture as clearance for the saw which splits the ring.

These fixtures, while not expensive, are very efficient in operation and are a very good investment for handling such work in moderate quantities.

RING THAT IS TO BE MACHINED AND SPLIT.

FIG. 3—FIXTURE FOR SPOT FACING.

COPPER BAND CRIMPING DEVICES

Rejected shells have often resulted from defective copper bands. This trouble frequently arises through the copper band being unevenly located when it is placed on the shell, the effect being to force the metal into the groove in an irregular manner, so that when the ring is subsequently turned it is found to be defective. A very useful tool that has been designed to overcome this ob-

FIG. 4—FIXTURE FOR SPLITTING RING APART.

jection is shown in the accompanying line sketch. The purpose is to crimp the band correctly in position before the operation of banding in the hydraulic press. Where a large number of shells are handled the device has proved a great labor saver and also been the means of eliminating much of the trouble formerly experienced through defective bands. To operate the shell is first placed in the centre of the fixture and then the copper band is placed over the nose end, and tapped to the desired position by means of the steel forging that is designed to pass over the shell. The device is so constructed that the copper band can only be forced to a location in correct alignment with the groove. When in this position the handle is pulled around and the cam plate forces the cams inward, pinching the copper band into its desired recess. The shell is then removed and is ready for the hydraulic press operation. The entire operation occupies about 10 seconds.

DEVICE USED IN CRIMPING COPPER BAND ON SHELLS.

RECENTERING ARBOR

In the efficiency of shell production an essential factor is that of the concentricity of the walls after the maching has been completed. During the preliminary operations this feature is not so important as the operations that follow the finishing of the interior. It is necessary that the centre in the base upon which the final turning is performed, be placed in exact alignment with the finished bore of the shell, and in order to do this it is imperative that the tools upon which this operation is accomplished, be rigid and highly accurate. The arbor here illustrated has given very good satisfaction and the work performed has been of the highest quality. The shank of the mandrel is made to fit the spindle of a small lathe, the outer portion of the shank being supported in the steady rest shown. The open end of the shell is centrally located at the inner end of the arbor by the cone shaped ring which is forced outward by the action of the compression spring. This allows for any slight variation in the length of the shells. The cast steel plunger fitted into the nose of the arbor acts upon the three cast steel tempered jaws, forcing them out to the inner wall of the shell and bringing the same concentric with the axis of the arbor and also prevent undue wear upon the gripping jaws. Very little pressure is required to operate the jaws, and the pressure of the drill when working is sufficient to maintain the shell in position.

Two Hamilton boys, Duncan M. Stewart and Charles C. Dickson, have been appointed to prominent positions on the executive of the French-American Constructive Company, of New York, a concern, it is said, with unlimited financial backing, that has recently come into being for the purpose of facilitating commerce and industrial rehabilitation in the Allied countries as soon as the war is concluded. This company has been organized ostensibly to promote trade between Canada and the United States and the Allied countries, to act as distributors for Allied concerns wishing to have trade intercourse with either Canada or the United States, and to purchase direct from Canadian or American concerns for buyers in the European Allied countries. The Duponts—a name that stands for some substance in the realm of finance—are large shareholders of the new company. Duncan M. Stewart, manager of the company, is a brother to Charles Stewart, of the Hamilton civic waterworks department. Charles C. Dickson, vice-president of the company, who received his early business training in the offices of the old Great Northwestern Railway in Hamilton, is a son of M. C. Dickson, of the Consumers' Lumber Company, Limited.

REPAIRING A LINE SHAFT

By J. H. Houldsworth.

A main line shaft broke between two couplings as shown in sketch, and was repaired in the following manner:

The shaft was 6 inches diameter, and the repair had to be executed as quickly as possible. The first thing done was to take a bar of steel and make two keys ¾ inch wide at the centre and 1 1/16 inch at the ends by ⅞ inch thick and 12 inches in full length. The keyway was drilled out with the shaft in place with a portable electric drill, then chipped out with an air gun and the keys made a good fit, two being placed diametrically opposite each other.

Four ½-inch holes were drilled and tapped in the shaft and fillister head screws were made with a long head to allow them to be screwed home tight.

Although a new piece of shaft was secured, we had no occasion to use it, as since the repair was made the whole thing was welded with a portable outfit which made a very satisfactory job and at a much less cost.

NOVEL CROSS SECTION PLOTTING SCALE

By Frank C. Perkins.

THE accompanying drawing shows the construction of a new cross-section plotting scale recently designed by Edw. A. Zorsch of Rochester, N.Y. The instrument consists of a horizontal piece and an arm. The horizontal part has a beveled straight edge, a scale, and a groove running longitudinally. The arm has a beveled straight edge with unnumbered graduation thereon, a looped flexible taper suitably graduated and made to move adjacent to the straight edge, and a spindle at the outer end by means of which the flexible tape can be moved back and forth. The inner end of the arm has a piece which fits in the groove of the horizontal member, and an index which cooperates with the horizontal scale.

It is pointed out that when using the instrument for plotting sections the horizontal member is placed with its straight edge on a horizontal line of the cross-section paper. The line is then given an elevation, after which the looped tape scale on the arm is moved until that number on the tape which corresponds with the elevation of said line is brought into coincidence with the line. The instrument is then ready to use.

It will be seen that distances to the right or left are read from the horizontal scale, while elevations are read directly on the arm. The use of this instrument lessens the error that is often made of counting the wrong number of squares, as distances and elevations are read directly on the scales. The instrument is adapted particularly for very rough, undulating sections. When plotting flat sections no vertical scale is necessary. With the use of this instrument sections can be plotted on plain, unruled paper.

THE EFFECT OF HEAT ON COLD ROLLED ALUMINUM

IN a paper read before the Institute of Metals by H. C. H. Carpenter and L. Tavener some interesting facts were brought forth relating to the behaviour of aluminum sheets when heated.

The effect of heating cold-rolled aluminum sheet at temperatures from 550 deg. to 300 deg. Cent. inclusive is to cause a very rapid softening of the metal as measured by the tenacity and the percentage elongation. As regards tenacity, the same ultimate value is reached in all cases. Softening is complete in 96 hours, and from 550 deg. to 350 deg. inclusive nearly the whole of this occurs in the first hour of the test. The elongation figures show a tendency to rise slightly as the temperature falls from 550 deg. to 350 deg.

At 250 deg. Cent. the rate of softening, while still considerable, is much less rapid. Between 600 and 800 hours are required for complete softening, and here also the same ultimate value of tenacity is reached as at higher temperatures.

From 200 deg. to 100 deg. Cent. inclusive the rate of softening is slow, and as the temperature of 100 deg. is approached, very slow. The actual sequence of changes can be classified conveniently under three heads:

(1) A comparatively rapid drop in tenacity in the first hour.

(2) A tendency either to cease falling or actually to rise, such rise, in one case only, bringing the tenacity up to the original value. This period is in most cases completed in 100 hours.

(3) A relatively very slow fall of tenacity sets in and is maintained on the whole steadily.

These tests are still in progress. Assuming the present rate of loss of work-hardness to be maintained, assuming also that the metal ultimately reaches the same tenacity as specimens tested at the higher temperatures, periods of the order of from one to three years will be required for completion.

It follows that no object is gained by using aluminum of this particular degree of work-hardness at temperatures which are likely to exceed 200 deg. Cent. in practice.

The cold-rolled aluminum has been shown to lose a considerable proportion of its work-hardness as a result of being heated in the temperature range, 200 deg. to 100 deg., with hardly any recovery of plasticity, as judged by the elongation test.

Le Chatelier's view that annealing a hard-worked metal was an easy thing to do was not borne out by the tests given in the paper, as far as aluminum was concerned. On the contrary, there was much evidence that Howe's view that many changes were going on concurrently was the fact with aluminum as with the other metals which Howe examined.

DEVELOPMENTS IN SHOP EQUIPMENT

Makers of equipment and devices for use in machine shop and metal working plants should submit descriptions and illustrations to Editorial Department for review in this section.

FILING MACHINE

The filing machine illustrated has been designed by the Barry Manufacturing Co., Chicago, Ill., to fill a want in the tool room of a machine that may be used for filing, lapping, metal jig-sawing, etc. It is especially useful in making dies, punches, jigs, patterns, and gauges, and also provides a marked saving in finishing small parts. The features of the machine provide for much more rapid, accurate and smoother work than is possible by hand filing and insures a saving of at least 200 per cent. The patented file holder on this machine admits of using any file, regular or special, without other equipment; jig or hack saws can also be used for sawing out dies and templets. The machine throughout is constructed with reference to durability and convenience in operation.

The table is adjustable four ways, to give any angle or clearance required on any work. Indicator scales and needles attached to table permit of accurate adjustment.

Roughing attachment provides a cam feed for fast roughing of dies and other work, and when not in use can be instantly removed.

Adjustable fingers on either side of table hold work firmly without marring and allow it to be moved freely in any direction on the table.

The ways are mounted above and to the back of work table; filings, emery powder or other abraders falling from work cannot deposit on the drive shaft or other working parts. Crossheads are slidably mounted on guide rods and carry file supporting arms adapted to operate below and above table; the distance between arms is readily adjustable to accommodate different lengths of file or similar instruments, the lower arms may be adjusted to operate close to table for different lengths of stroke.

The file holder will hold ordinary or round shank files, readily adjusting itself to taper of shank of file or similar tool. When the file is worn in one spot it may be shifted until the whole file is worn on all sides.

The countershaft is attached to base of machine and has a three-step cone, carrying a 1½-inch belt, which gives speeds of 200, 350 or 600 strokes per minute; the drive being controlled by foot treadle. Driving belt on counter shaft is 2 inches.

Motor drive can be used if desired. One-half h. p. motor of any type with speed between 1,200 and 1,800 r.p.m. can be used.

UNIVERSAL FILING MACHINE.

HEAD TESTING MACHINE

The "Lea" lead testing machine, sold by C. H. Tracy Co., Boston, has a three-point bearing—two stationary and one adjustable—making it easy and quick to level. The thread contact point and the micrometer head are carried on a ball-bearing carriage, or slide, so delicately adjusted that the operator can blow it back and forth with his breath when the contact point is not engaged. The thread-contact point is held to its work by means of a spring, and it may be moved from one thread to another by pulling it back by means of the small knurled handle shown. The thread gage to be tested is carried between centers. To test the lead the contact point is placed in position in one of the threads and then the micrometer spindle is adjusted so that the pointer on the dial indicator points to zero. The thread-contact point is then moved along one, two or more threads, as the case may be, and the micrometer readings taken and compared to the theoretical amount. Drunken threads are easily detected by turning the gage part way around and again measuring.

In doing the measuring the micrometer

TESTING MACHINE FOR INSPECTING THE PITCH OF SCREW GAUGES.

spindle is adjusted so as to bring the dial indicator pointer again to zero. From this it will be seen that the dial indicator is not used to actually measure with but only to show the correct amount of pressure to apply to the micrometer spindle. It will be noticed that the micrometer sleeve carries a graduated gearwheel while meshed with a pinion attached to a special counter. By the use of the large graduate wheel, readings are obtained to 0.0001 in. As the wheel turns it operates the counter, so that the operator can read his measurements directly and instantly, which greatly adds to the speed with which a gage may be inspected. In using the micrometer no damage is done in case the spindle overruns considerably. When it is not advisable to depend on micrometer readings, Johansson blocks may be used between the dial spindle and the micrometer spindle. A plug is also provided so that the dial indicator may be removed and a solid plug used in place of the indicator spindle. Johansson blocks can then be used between the contact points as before. The machine will test thread gages up to 6 in. in diameter and 6 in. long. It weighs approximately 60 lbs.

PORTABLE RADIAL GRINDING MACHINE

The Mummert Dixon Co., Hanover, Pa., have bought out a portable radial grinding machine. The machine is primarily intended for general light grinding and buffing work, and the wheel can be raised as high as a man can reach or brought down to the floor, in addition to being turned into any position between a plane at right angles to the floor and one parallel with it, as well as having a slight longitudinal movement.

The machine is a self-contained unit and is readily portable. The grinding wheel, which is 8 in. in diameter, with a 1 in. face, is driven by a motor mounted at the rear end of the tubular arm. This motor, which receives its supply of current from an adjacent lighting socket, is coupled to a shaft running through the tubular arm to a set of hardened steel spiral gears in the head. These gears are enclosed in an oil tight gear and increase the speed from 1,800 to 2,800 r.p.m. The head, arm and motor are carried on a two-wheel ball-bearing trolley, which rolls back and forth on a steel track for a distance of 30 inches. A rack and pinion on each side of the carrying frame is relied upon to keep the trolley in alignment. The motor tends to balance the head, and as it is mounted below the center of the trolley shaft, keeps the whole weight in equilibrium when the workman releases his hold. The bolster of the frame carrying the trolley is mounted on the upper end of a trunion which turns in the base. In this way the arm and the grinding head can be turned entirely around the base, thus giving a full radial grinding machine. It is also possible to twist or turn the head completely around so that the top, either side or bottom of a casting can be ground.

When the machine is being moved the trolley can be locked in the middle of the frame, and by inserting a lock pin the bolster can be locked to the base so that it will not turn radially. This arrangement, it is pointed out, will be found advantageous when the machine is being moved over the floor, since the arm can be used as a guide, similar to a waggon tongue.

In addition to the machine illustrated two larger sizes are built. One of these is designed to mount a wheel 14 in. in diameter with 2 in. face, while the other will mount wheels 3 in. wide and either 18 or 20 in. in diameter.

BROKEN GAUGE GLASSES

By M. M.

The following hints concerning broken gauge glasses cannot be too forcibly impressed upon engineers. It is not only a matter of knowing how, but also being able to practically apply the knowledge effectively and expeditiously. The cocks on the boiler should be immediately shut and the glass replaced without delay. The new glass should be free from flaws or scratches, with ends ground square or fire-finished and of the correct length. If too long it would restrict the passage of steam to the glass; if too short, the packing may work over the edges of the glass. In many makes of gauges the correct length of the glass is stamped on the framing.

Before replacing it, the whole of the old packing should be removed, and the screws of the adjusting glands made easily workable. The packing should be placed on the glass, and while screwing up the bottom gland the glass should be kept in contact with the metal of the lower cock. Care should be taken not to screw up the upper gland hard before the lower one, as this may lift the glass, and perhaps allow the lower packing to choke the orifice.

The glands should at first be screwed up hand-tight, after which the steam and drain cocks should be opened a small amount to heat the glass gradually, when after a short interval the water cock should be gradually opened, and then the drain cock closed, the steam and water cocks being then fully opened gradually, and the glands adjusted as required. The glass should now be tested by closing the steam cock and opening the drain, when water should rush out freely. The water cock should then be closed and the steam cock opened, when steam should rush out freely. When the drain is closed and the water cock open, careful note should be made of how the water rises in the glass. It should, if the fitting is properly made, rise smartly to the water level of the other glass.

Courtesy Does Not Cost Very Much

IT doesn't cost a very great deal to be courteous. It's the cheapest thing in which a man can invest and yet it pays handsome dividends. An experience that was related to us this week is well worth passing on.

A representative of a big house with branches in nearly all the worth-while cities of the world, had occasion to make two calls in the same city—and that same city was Toronto.

The traveller was a high-priced man, an expert in his line, and he considered it was in the interests of both the firms in question that he should call on them. He was too well versed in his business to take up more time than was absolutely necessary. Here is his experience:

"The first place I called was a firm employing some three hundred people. I asked to see the general manager. My card was taken, and after waiting some time the messenger boy went in again, and came back with the information that the manager was busy. I knew there was no one in his office for I could see in his window before coming into the building in the first place. After another short wait he came out of his office, and I was forced to grab him, book-agent style, to tell him I was around the premises. I could get no hearing at all. He would not even pass me on to his superintendent or purchasing agent. I left and I will never go into that building again, neither will I be particular to look after that man's business if he sends it to me.

"The next call I made was at the other end of the city. There was a little room where callers waited until the manager was able to see them. I seated myself there and within a very short time I had a chance to see the man I wanted. I did not even have to brush past a secretary or ring a bell. That manager came out and shook hands with me and asked me to come in and sit down. I told him the firm I was from and what I wanted to show him. He rang for his superintendent and then said, 'Both the superintendent and I are very busy today, but we will give you 20 minutes right away.' I had not taken up five when the superintendent said he was interested enough to have me come into the factory with him and go into the matter in detail. That satisfied the manager. I closed a nice order there and dropped in to thank the manager after for his courtesy and kindness. That manager controls four times as much business as the first man, and so I take it his time must have been worth much more. He could have turned me down and I know he would have done it in such a way that I would have been satisfied with his decision."

That same thing happens every day in the week. There's nothing so very new in it at all, its newness consisting in the fact that it happens so often.

But get it into you. Get it into your staff. Get it into your men that meet the public. Paste it in their hats and stamp it on the soles of their boots. Courtesy costs nothing at all, but its presence makes and keeps wholesome business conditions, and its absence spoils and mars the whole landscape, and kills off business chances faster than any other power can build them or pull them together.

Trained Hands For Farms and Shops

THE farming community in Canada has been making very serious objections to the taking of green hands hands on the farm.

In many cases they are referred to as useless, and the statement is made that a farmer takes so long in instructing them in the work that they are really a loss in the end.

On the face of it the farmers seem to be able to put up a pretty good case.

But what has been the experience of the manufacturer, of the merchant, of the publisher and of every branch of industrial life since the beginning of the war?

All through it has been a case of do the best you can with the material at hand.

If a publisher were to take the attitude regarding a prospective employee: "You are not experienced. You are not a good journalist of proved worth, therefore I don't want you," what would be the result? There would be so many empty chairs in the office that the publication would never reach the public.

And what of the manufacturer? There has been a scarcity of available men that has been almost overwhelming in spots. Could the manufacturer give instructions to his employment office that they were to say to every applicant for work, "If you are not a skilled mechanic there is no use of you applying here for a job?" Not much. There would be very little production were that the case.

The publisher has had to take the greenhorn and train him. He has had to lose money and time on him for weeks before he was able to earn his salt, and a good many times he found out that after weeks of attempted training he had picked a lemon.

The manufacturer has had in many cases to conduct very costly experiments to find out how far he could go in employing unskilled men in his shop. There have been breaks and annoyances without end, but the manufacturer had to make the best of it, and "carry on," and like the publisher he has accepted the situation as it stood and made the best of it.

Why should the farmer not look at the thing in the same way? He cannot have trained help when it is denied to the rest of the community. There are cases where greenhorns to farm work are making good as they have done in other lines. It takes no greater skill to drive a binder than it does to run a lathe, and the wielding of a hoe is no more complicated than the writing of a heavy editorial.

The farmer can get a whole lot of service out of the greenhorn help if he will set himself seriously to it.

A NUMBER of the daily papers are howling away that Canada's assortment of Cabinet Ministers should hustle back home from London, England, and attend to affairs at Ottawa. Then again there's not a few who incline to the belief that we get along remarkably well when the whole outfit's a long way from home.

IT USED to be considered a bit smart to refer to the farmer as a hayseed, but when one stops to think that farmers lead the automobile procession, and are the leading group in paying off mortgages—well, it all tends to popularize the hayseed group.

ANDREW GLEN CAME FROM SCOTLAND IN 1912

And Has Been Manager of the John T. Hepburn Plant for Two Years—A Want Ad. Brought the Right Man

IF your father's name is trusted to one or two initials for what individuality it had—if his name was Smith, Brown or Jones, for instance—no fair body could blame you for secretly wishing you could swap names with Andrew Glen. His name is more than likeable; it is Scotch both going and coming. So is he.

Fifteen years ago, as a lad of sixteen, he started work in the plant of Lees Anderson, which is on the Clyde at Glasgow. Had young Glen been a few years older, or had no business depression followed the Boer war, Lees Anderson, makers of marine engines, might be on the high-tide of prosperity to-day. As it happened, however, they carried on until the subject of this sketch learned all their drawing office could teach in two and a half years.

ANDREW GLEN

The last pulley had hardly stopped in the Lees Anderson plant before young Glen was applying what he had learned—and learning more—in the plant of Alexander Chaplin & Company—one of the largest crane makers in Glasgow. Another two and a half years at the pay of an apprentice, and he graduated as a full-fledged mechanical draftsman.

But Andrew Glen had not been content to work and learn. He had wanted to study and learn as well. During the years of his apprenticeship, therefore—years with more nine-hour working days than many men, let alone youths, care to manhandle—he studied at nights. Three evenings a week he attended technical college. Nor did he reach it by walking across the street. It was six miles from his home.

About the time that Babcox & Wilcox of Renfrew, which is near Glasgow, discovered that a good man like Glen, either goes up or goes out, John T. Hepburn, of John T. Hepburn, Limited, Toronto, concluded that the Old World owed the New the man he needed. And he used the New World method to find him—that is to say, he advertised.

Glen answered his advertisement, interviewed Mr. Hepburn's brother-in-law and, two weeks later, took charge of the drawing office of John T. Hepburn, Limited. This was in the year 1912. If questioned to-day, Mr. Hepburn would probably say no advertisement of his ever paid better than the small help wanted that found Andrew Glen.

The young man soon demonstrated that he knew a thing or two about cranes. (John T. Hepburn, Limited, manufactured cranes exclusively up till the outbreak of hostilities). Moreover, Glen showed rather unusual ability in directing work to speedy accomplishment as well as in the perfect planning of it. Consequently, within two years following his engagement, he was made manager.

Almost simultaneously with his appointment, the urgent needs of war called for a radical change in product. The manufacture of cranes could wait; the manufacture of shells and shell-making machines could not. Glen's was a man-size job all right!

How did he handle it? The well-known Hepburn special lathe for munition makers is one favorable answer. Another is the fact that John T. Hepburn, Limited, recently acquired the plant of the Martin Pump & Machine Company, in which forty men are already employed and which will produce at least, three Hepburn special lathes daily. A third, and equally significant answer, is the fact that two hundred and fifty men are employed at the parent plant, now manufacturing six-inch shells as well as special shell lathes. A fourth—is a fourth needed? No. Just consider that Andrew Glen has yet to count his thirty-second birthday.

"It isn't the salary cushion of an executive's chair—it isn't that," he said, "that drives a man to study and work his way into it. I think it is our competitive system, the pitting of men against men. The failure is all eyes for the immediate dollar. Not so the man who wins. He keeps half an eye on the dollar and an eye and a half on his work and on the textbooks and technical magazines that help him master it."

Young machinists need not conclude that an hour or two of serious study after work will prevent their enjoying healthful recreation. Andrew Glen snatched time to play association football and to win more than one road race, ten-mile marathons included. He has his medals still.

His life mirrors ability to do the things worth doing. True, he confessed, "I've never had time to get married."

But there's time yet—he's only thirty-one.

An Appetite's A Bad Thing Now

THIS cost of living is a thing what causes me to fret—I'm worried in the day time, and at night I can't forget. Why everything folks get to eat is priced so bloomin' high, that a purse would need, by gum, to reach well nigh unto the sky.

We used to buy the sausage cheap, about ten cents a yard, a nickel for a T-bone steak, and 'bout the same for lard.

And liver, too; land sakes alive, they used to get it free—it used to cost ten cents for lunch and less'n that for tea. And look at spuds, the Irish kind, the onions and the beets, and every other thing that comes in servin' up the eats.

And if you want a dozen eggs, the big ones and the slim, it costs you over half a bone, why say, they don't begin to touch the good old buying times, now gone a long time hence, when hen fruit used to sell galore at twelve and thirteen cents.

When we was kids we used to take a quarter to the store, and have a list a foot in length of what we hustled for.

And for that coin we used to get some butter and some ham, some eggs and rice, a pound of tea, and salmon in a can. We used to stack up all these things upon the kitchen range—and dig deep in our jeans to land the coin we got in change.

We passed up ham and bacon, too, and roasts of every sort, to try and keep our carcasses from wanderin' into court. And ground up steak has got the boots, rump roasts have gone likewise—we never get a hunk of ham, nor dig in on meat pies.

It is a sad, a lonely world, there's just one thing, by heck—we sometimes buy a slab of chuck what's carved from off the neck.—ARK.

MARKET DEVELOPMENTS

Final Allotment Made by Ottawa War Board

Dealers Who Are Trying to Handle the Business Finding it Harder to Secure Actual Supplies Than the Permits Covering Them—More U.S. Contracts Going to be Given Out?

DEALERS in Canada who are trying to spread around the available supply of steel, among the many firms that present orders for same, are having troubles of their own during these months. It would appear that the procedure is this way: The authorities at Washington, through the war board there, give a certain proportion of the output of U.S. mills to Canada every month. It is then up to the War Board at Ottawa to distribute this supply. This really means that the War Board at Ottawa has got to take on itself the onus of stating which firms in Canada shall have a preference on available supply of material, and the agricultural and other interests are not going to stand aside while the distribution is taking place unless they are being favorably considered in it.

Although nothing definite has been given out yet, it would not be surprising were an announcement to appear in the near future that the American war contracts in this country were to be considerably enlarged. Rumors from some of the steel centres in the U.S. which are very reliable, state that new sizes are being considered there and also draw attention to the fact that a very much increased autput of shell steel is asked for in the next few months. Canadian firms have made an enviable reputation for themselves by the way in which they have handled U.S. business on previous occasions. No doubt they would be favorably considered in any extension to the war program of the republic.

Although reports have not indicated it, the labor situation is causing some trouble in certain localities. One place where it shows very plainly is in regard to the scrap metal situation. Reports from a large number of the big centres in the U.S. state that the labor shortage is causing some delay not only in the bringing in of material in the first place but also in the sorting after it reaches the yards. In this way it is retarded from a quick move to the foundries, where it is very much needed at the present time.

Agents in this country who are handling British high speed steel believe that an effort may be made by the firms in the Old Country to get better shipping facilities to this land. In the last few months there has been a tremendous demand for high speed steel by almost every factory handling war orders in Canada, and U.S. firms have cut into his business to a very great extent. And in order to protect their interests here, British firms are likely to make a very determined effort to get their goods into the Canadian market as quickly as possible. Shipping facilities have worked against them in this regard in the past in no uncertain way.

Prices, as a general thing, have been holding remarkably firm during the week. As a matter of fact the whole range of prices has shown very little tendency to change. Reports to-day indicate that galvanized sheets are likely to go up. The mills cannot secure the black sheets for galvanizing, and the chances are that as a result all light gauges of sheets will go up. Apart from this no price changes or indication of changes are reported during this week.

FINDING IT HARDER TO DRAW NOW FROM UNITED STATES SOURCES

Special to CANADIAN MACHINERY

MONTREAL, Que., Aug. 7, 1918.—Despite the fact that the present period is generally one affecting trade conditions, the activities at the present time are almost normal in character. Production has fallen off slightly but not sufficient to affect the general conditions. The steel situation has developed an acute turn owing to the inability to get material in from the American mills. The metal market is operating under considerable tension due to the scarcity of some of the metals. Old materials are quiet with dealers reporting a nervous undertone.

Tension in Steel Situation

The continued demand for steel, coupled with the decline in production, as a result of the warm weather, has maintained the tension that has marked this situation during the past several months. That this condition may be still further emphasized is shown by the increased difficulty in obtaining ship plates from the States. Trade in steel plates has virtually been taken out of the hands of the War Trade Board as the mills in the States are unable to meet the present abnormal trade requirements. Plates for ships under Government contract are coming through but with less regularity than formerly and shipyards are consequently working at a disadvantage. Unless plates are specifically required for essential uses no consideration whatever will be given to orders placed for material. Local supply of steel plates is rapidly being depleted an dthe situation is taking on a very acute turn. Shell steel is coming along in fairly good volume, but the output has been interferred with by the holiday season, and labor shortage. Foundries are active producing billets for the recent contracts for 9.2 inch, 155 m.m., and shrapnel shell forgings. In the semi-finished steel trade the sifting out of so-called non-essential activities has added to the difficulties of obtaining material for enterprises indirectly associated with war work. The market here,

if such it may be termed, is relatively quiet and all quotations are firm, but virtually on a nominal basis.

Metals

The feature of the week appears to be the difficulty experienced by dealers in obtaining metal to meet their immediate requirements. Tin continues to be the center of interest and the developments in London have had the tendency to strengthen the market here. Copper is hard to obtain and the situation is very firm. Lead is showing a tendency to advance owing to scarcity. Spelter is weaker on quiet demand. Antimony and aluminum are both quiet, but comparatively firm.

Copper.—The difficulty in obtaining supplies of copper from the United States refineries has placed the dealers here in a very uncertain position, and the general situation is one of extreme nervousness. Local stocks are declining and the undertone is noe likely to develop into a stronger market. Agitation for further price regulation continues to keep the trade in tensive mood. Dealers here report a rising market, quotations at 31 and 32 cents being an advance of ½ cent over last week.

Tin.—The situation in this metal is again developing a very acute stage owing to the inability to acquire sufficient tin to meet the requirements of essential needs. The uncertainty of delivery from England and other sources gives the market a nervous tone, and with local stocks gradually falling off prices here have advanced to the previous high. Dealers for some few weeks past have been quoting the nominal price of $1.10 per pound, but this week have again advanced to $1.25.

Lead.—Dealers are having some trouble supplying the demands of customers owing to the apparent scarcity of the metal. The present requirements are relatively heavy and stocks here are light. The market is very firm at 10½ cents, but the tendency is upwards.

Machinery Demand Slackening

Afalling off in the general demand for machine tools marks the developments for the week. Shell machinery is not quite so active but this is to be expected, as most of the plants recently receiving renewal or new contracts have placed their equipment orders. The chief concern of both dealer and manufacturer is getting the delivery of the different tools required. Shipment of equipment coming in from the states is very indefinite and the delays are causing considerable inconvenience to the producing trade. Partly used machinery is selling well, and this equipment can be secured more easily than new tools owing to the fact that second-hand machinery is not controlled by tre same selling regulations. Trading in this respect is comparatively heavy and tools are quite plentiful.

General machine shop supplies and accessories continue very active and the market is very firm.

Nervousness in Scrap

Apart from the nervous tone created here over the report that copper scraps would shortly weaken and prices decline, the situation is comparatively unchanged. The general demand has quieted down and buying is almost exclusively for consumers immediate requirements. The marked uncertainty has developed a reluctancy on the part of consumers and trade on all metals has become restricted. Quotations are firm with an unsteady undertone.

POINTS IN WEEK'S MARKETING NOTES

Reports from the big scrap metal centres make it appear certain that a shortage of labor is causing considerable delay in sorting scraps and getting it out to the consumers.

—

In every case now dealers who are getting a supply of pig iron are tied up on government contracts so that it is impossible for them to use any material for any other purpose.

—

Steel jobbers in Canada are finding it more difficult to secure their supplies from Ottawa. It appears that a certain allotment is made at Washington, to Canadian consumers, and it is up to Ottawa to distribute that.

—

A request came in to the American market this week for the supplying of a large number of machine tools to manufacture bayonets. This is about the first time that this work has been taken up.

—

Pittsburg reports to this paper that it is a much easier matter to secure a license from the War Board there than it is to secure the material itself after getting the license. The supply of steel is far short of the distribution for which the license provides.

—

Reports are in circulation that the shell programme of the United States is to be greatly extended. Some details have been given out, but on the whole information is lacking as to the number and size of shells to be brought out in the next few weeks or months.

—

Absolutely no information at all is being given out by the authorities in regard to the building of the greatest ordnance factory in the world at Neville Island. It is stated that the first guns will be turned out from there the beginning of 1920. As a matter of fact this date will be hastened by a good many months.

HARDER TO KEEP ORDER BOOKS CLEAR

Washington Gives Lump Portion to Canada, to be Divided by Ottawa War Board

TORONTO.—The steel jobbers are finding it harder to fill the orders that are pouring in on them, and they are going to find it harder later on. There is no end of orders, and as may be supposed every firm sending in an order is quite sure that his work is of the utmost importance toward the winning of the war and should beb shoved right through Washington and Ottawa and any other centre that has to do with the granting of the license. Washington, in allocating the output of American mills, lumps the portion that shall go to the Canadian users, and tosses that over to the War Board at Ottawa, and it is then up to that body to go ahead and worry with the Canadian consumers, trying to keep the strictly war business concerns to the front. The further this system is put into effect the more trouble there is bound to be, and the harder the work that will fall to the lot of the War Board at Ottawa.

Prices have shown no great tendency to change during the week. The holiday at the week-end has eased matters up a little, although in some cases there are tendencies that prices will move along again soon. From the way matters are moving it looks as though galvanized sheets were due for a higher level. The mills are finding it harder to secure a supply of the black sheets to galvanize. In fact all the light gauges of sheets are liable to go to higher levels before many days.

There is no improvement in the boiler tube situation especially as it affects the smaller sizes. There is a fair amount of the larger sizes left, but the big demand just now is for the size around two inches.

Scrap Metal Situation

Prices that have been quoted by the dealers during the last week will continue to govern the dealing during the next week or so unless something very unusual turns up. There is always a period of price stagnation around this time of the year, and the only thing that has turned up to interfere with it recently was the trend of copper and brass upwards following the action of the U. S. government in raising the fixed price on copper.

As a matter of fact there is a good deal of scrap passing just now that the dealers are not touching in the transaction. One of the largest dealers in this district stated to-day there were many of the mills with a good supply of heavy melting scrap on hand, and he did not know where it had been secured. There is only a fair volume of business moving. Scrap is not being located easily, and in many cases those who secure it in the first place are forced to go farther afield for it than formerly,

and in this way they want more for their work. The labor problem not only in the scrap yards but in the premises of some of the big scrap sources keeps a lot from the market. There is not the help available to properly sort the material, and so it is held back.

No definite word has been given out regarding the disposal of the electric line from London that is passing into the hands of the scrap merchants. There is quite a bit of interest locally in the deal and it is known that several of the dealers have made a number of trips to London to look the proposition over. It ought to be definitely known in the next few days what will be done. Foundries continue to inquire for good machine scrap to ease off on their piles of pig, especially if they are not in a line that will be guaranteed a supply by the War Board at Ottawa.

THOSE WHO GET PIG IRON ARE TIED TIGHT TO THE GOVERNMENT

Reports received from the various producing points in United States on the pig iron situation are as follows:"

Philadelphia.—Small lots from the Virginia makers are being sold to some of the foundry iron buyers here. Only two cars per customer are now being distributed and sales are being made only after receiving declarations of purpose from the consumers. Delivery will be made after all priority and allocated orders have been shipped.

Boston.—Some Virginia iron has been arriving here in the last few days but none of it has ever come into the open market as it has all been directed to consumers' destinations. These customers are on the preferential list and were tied up forty different ways by the Government and only one or two cars for each customer were received. Good progress is being made on onld contracts.

Pittsburgh.—Inquiries for both steel making and foundry iron continue to come forward here in very large volumes but the producers generally continue to withhold making any promises. Rather a new feature here is that many of the producers consider that it would be good policy on their part to make contracts on three months' terms, claiming that that is the period for which the Government regulates the prices.

New York.—Some of the Alabama furnaces have been taking considerable orders here for future deliveries and some of the foundrymen may have thought they were in for fairly good supplies. Later orders, however, have it that instructions from the producers to the agents were to cut down on these orders so they were reduced very materially. All of the iron thus sold was without any guarantee of any kind and delivery is to be made only after all the Government orders are filled.

Buffalo.—There is an inclination here among the furnace men to leave the distributing of their future products to the authorities at Washington as they apparently reckon that the Government people will get it sooner or later. In one case a furnace man here took on 1919 business during the last week but that was from an old customer whose plant is working 100 per cent. on Government orders, and he desired simply to be covered as a matter of preference.

Cleveland.—The demand here for pig iron continues to be very, very heavy and most of the consumers are able to show without any doubt that any iron consigned to them will be used for essential purposes and on this account shipments are going forward quite freely. The call now for iron for steel purposes is simply tremendous and it is thought here that a number of the furnaces that are now turning out pig iron will be ordered in the very near future to switch over to the basing material before the month is finished.

Cincinnati.—It appears almost certain now that the stove makers here will have to curtail their product to a considerable extent as only a few of them have been able to make contracts for iron. The word has been pased along that only those that have contracts calling for the supplying of towns for army purposes will be able to get all the iron they need an dthe others will have a hard time in getting metal that is to be used in the non-essential work.

St. Louis.—The war plants in this district are practically getting all the pig iron they require at the present time. Stove makers and others who turn out specialized lines are feeling the pig iron shortage and in many cases they have been resorting to the use of an unusually heavy tonnage of scrap.

Birmingham, Ala.—The belief is expressed in some quarters here that those who have been anticipating an increase in production of pig iron are going to be disappointed. Inquiries are coming in very rapidly and it would be a very easy matter to sell the entire product for 1919.

WANT TOOLS FOR MAKING BAYONETS

Unusual Demand Made For a Large Quantity of War Machinery

Special to CANADIAN MACHINERY.

NEW YORK, Aug. 7.—Gun makers are the largest purchasers of machinery in the market at present and several large contracts, calling for the expenditure of $5,000,000 to $6,000,000, are still before manufacturers; at the same time, new inquiries for machine tools have fallen off in the past ten days, which is accounted for by the recent Government decree, practically establishing a barred industrial zone on the middle Atlantic seaboard and in New England.

As various factories in the middle West are converted into munition plants there is naturally an increase in the placing of many small orders for metal working machinery. Dealers and distributors of tools in Chicago have benefited largely from this business, working at very high pressure. The volume of business has been made up, however, of numerous small sales rather than of individual large lists. At Cincinnati and Cleveland there has been a falling off in large inquiries as well as in New York and in Philadelphia.

For Making Bayonets

An interesting development has been the active demand for the lighter types of milling machines. This phase of the situation has been brought out by manufacturers in Milwaukee, who, within the last week have received telegraphic inquiry from an Eastern manufacturer of bayonets for 62 light milling machines. This is the largest inquiry for such light tools that has ever come before the Milwaukee trade, but as the Government is now placing large orders for munitions in the Central West, this demand is likely to increase rather than otherwise.

Still in Millions

The Midvale Steel and Ordnance inquiry for 300 to 400 machine tools and for 104 cranes to be installed in the sixteen-inch howitzer plant at Nicetown and calling for an expenditure of about $2,000,000, are still before the trade. Negotiations also continue on about $3,000,000 worth of cranes for the Neville Island Ordnance plant that is being built by the United States Steel Corp. Plans for these works, while not completed, have progressed sufficiently to make it certain that the American Bridge Co. will be called upon to fabricate 150,000 tons of structural steel for the various buildings to be constructed in the next eighteen months. As a result, the American Bridge Co. has been compelled to refuse several large Government orders calling for about 30,000 tons of steel for the construction of nitrate plants and other military buildings.

Marine Shapes

The pressing demand for the fabrication of steel for shhipbuilding has caused the American Bridge Co. to devote, temporarily, its Trenton, New Jersey, shop, entirely to the fabrication of marine shapes. These plans have caused the suspension of the steel barge building at Trenton for which the shops were especially equipped about three years ago. The Bridge Co. is fabricating steel at Trenton for fifty ships, 30 of which are being constructed by the Merchant Shipbuilding Corp. Bristol, Pa., and 20 by the Federal Shipbuilding Co. at Kearny, New Jersey. Incidentally, the Federal Co., which has just ordered two more cranes, expects to launch its second 9,600-ton boat for the Government about Aug. 10th.

The Newport News Shipbuilding &

Drydock Co. has put out a revised list of 15 cranes for its marine boiler plant at Richmond, Va. The Bethlehem Shipbuilding Corp. has come into the market for six additional special cranes for its Alameda, California, works. Purchases of 34 cranes for marine boiler shops are being made by the Sun Shipbuilding Co., Chester, Pa., and by the Barber Asphalt Paving Co., the latter for its Iroquois works at Buffalo.

MUCH EASIER TO SECURE LICENSE THAN THE GOODS TO FILL THE ORDER

Special to CANADIAN MACHINERY.

PITTSBURG, Pa., Aug. 7.—There was a time when it was difficult to secure export licenses. The much stricter measure of steel control by the War industries Board has made it easier to secure the licenses, but of course it is more difficult to secure steel. In other words, steel shipments are so difficult to secure that once the War Industries Board permits any steel to be shipped the War Trade Board does not see that it has occasion, as a rule, to demur at granting the export license. In the case of Canada, requests for licenses are made to the Canadian authorities, who in turn apply to the War Trade Board at Washington.

New regulations issued from time to time relating to the distribution of steel cause more or less confusion for a while, but they soon come to be well understood and the mills find it easy to follow the regulations, so far as the regulations are concerned. Their difficulty is in the fact that the supply of steel is far short of the distribution for which the regulations provide. Time after time the steel industry has looked forward to a surplus of steel, or at least to a condition when the quantity required would not exceed the supply, and repeatedly it has been disappointed. The relations between requirements and supply have been growing tenser even in the past week or two and mills have now given up any expectations that steel will become relatively plentiful.

Expanding War Program

The shell program has been greatly extended. Some details have been given out, but on the whole, information is lacking as to the number and size of shells to be handled in the next few weeks or months. What is definitely known by the steel trade is that it is called upon to furnish much more shell steel than formerly. One estimate is that in place of 425,000 tons a month lately furnished there is to be provided 500,000 tons a month for the remainder of the year. These figures are probably below the mark rather than above.

The extent to which consumption of steel in shipbuilding is expected to grow is clearly brought out by the fact that there is now accumulated something like a million tons of steel at shipyards and the fabricating plants serving them, but C. M. Schwab, Director General of Shipbuilding, wants to increase this stock, and is calling upon the plate mills to make stronger efforts. It is plain that if with rate of shipping in the past few months a million ton stock could be accumulated in so short a time, the rate of shipping was far in excess of the rate of consumption, hence if heavier shipments are desired it means that the rate of consumption is expected to increase very greatly. This can readily be understood, for the shipways now in operation should work more and more rapidly as time passes and there are many shipways still to be completed. It is a curious thing that there is no official information, in anything like complete form, of the number of steel shipways completed and to be completed. Fragmentary information on the subject makes it clear that the number in actual operation at present will be largely augmented.

Greatest in World

As is well known, the greatest ordnance factory in the world is being built on Neville Island, in the Ohio river, a few miles below Pittsburgh, through the formation of a partnership between the United States Government and the United States Steel Corporation. The partnership contract is a remarkably brief one. The Steel Corporation supplies the organization and engineering services, gratis, also the blast furnace, already existing and the steel-making department it will build, these to remain the property of the corporation. The Government supplies all the money for building the ordnance factory proper, and will own it. The main offices of the "U. S. Steel Corporation Ordnance Department" are located in the building in which this report is written. Despite the magnitude of this undertaking and the great public interest there is in it, there is absolutely no information given out for publication. When the announcement was first made in Washington it was intimated that the plant would turn out its first big guns early in 1920. The statement is rather amusing, as it merely represents the War Department profiting by its experience in connection with the aircraft program, which was set for a little bit too short a time, hence much criticism when it was not carried out. The guns will undoubtedly be in actual service before the beginning of 1920. Illustrative of the lack of information on the subject, one of the Pittsburgh daily papers prints a statement that the contract for the "grading and foundations" has been let, amounting to $5,000,000 or $6,000,000, which is quite absurd, for Neville Island requires no grading and the cost of foundations is necessarily only a small fraction of the cost of the buildings and machinery they will support. Equally out of line is a statement published in all seriousness that the American Bridge Company will be called upon to fabricate 150,000 tons of steel for the buildings during the next 18 months, while the total fabricated steel will be 200,000 or 250,000 tons. Either the time mentioned is altogether too long, or there is included a large amount of fabricating for gun carriages, etc., as the plant operates. One thing, however, is well known. The plant will specialize upon very large guns, particularly 14-inch and larger, with their ammunition, and its operation will not interfere in any way with the regular shell program as being expanded from time to time.

Steel for Jobbers

The War Industries Board's regulations dated July 2, relating to supplies of steel for jobbers during August, have been received in various moods by the steel mills. The general program, previously formulated, is for jobbers to confine their shipments to the purposes on the preference list, report the shipments by month. A special arrangement has been made for August, however. This is that the mills ship jobbers during August an amount of steel equal to the average monthly shipments in the first half of this year. The replacement steel was given Priority B-4 and it is assumed that the August shipments are to be regarded as having the same priority. Some mills point out that they could not ship in August without having scheduled the material weeks before. Others observe that they have so many higher priorities that they could ship very little material against a B-4. Others explain that they have no specifications from jobbers on which they would venture to ship, expecting the material to be what the jobbers most need. They have specifications filed last November, and the jobber, given the privilege of receiving a certain tonnage of steel, might want an entirely different description now. Other mills say they have studied the regulations and expect to experience no difficulty in carrying them out. It is partly a matter of temperament and partly a difference in the position of different mills.

Production

Production continues very satisfactory indeed, considering the conditions. In every previous year there has been a sharp curtailment in July and August, due to the heat. This year the industry has run through more than half the period and is, in substance, maintaining the excellent rate shown in June.

SHELL CASE BLEW TOY OFF FURNACE

The Unlucky Number 13 Was The Number That Contained Live Matter

The Judson Iron Works, Oakland, Cal., received a carload of scrap from Arizona last week which nearly wrecked the plant. The load included a number of 3-in. and 5-in. shell cases, and some of them proved to be still loaded. The explosion of one of these shells in a furnace blew off the top of the furnace and narrowly missed doing some very serious damage. Investigation revealed 25 such shell cases in the shipment, 13 of which were loaded.

SHORTAGE OF LABOR MAKES IT HARD TO SECURE SCRAP NOW

In connection with the scrap metal situation in many of the large points in the United States it would appear that the labor shortage is one of the biggest factors interfering with the sorting and securing of supply for the foundrymen. Reports from the various centres are as follows:—

New York.—A great many of the larger yards here have been forced to curtail operations on account of the labor shortage. Cast scrap remains in particularly heavy demand with the bulk of this material going to local foundries. Reflecting the continued sharp demand for cast scrap are the higher prices now being paid for stove plates and grate bars.

Boston.—There is a large volume of trade moving but labor is holding back a good number of the contracts and causing some serious delay in the filling of them. It is a safe estimate to say that in some weeks the yards are unable to handle any more than 50 per cent. of their work, while at the outside 60 per cent. efficiency has been about the normal figure during this sommer.

Philadelphia.—Small lot trading seems to characterize the scrap situation here, as it seems to be very, very difficult to locate any large tonnages. Borings and turnings are being eagerly sought by blast furnaces to increase their output of pig iron and reduce the coke consumption. The labor situation is also a very acute one here, although in some cases it is pointed out that the yards that are having trouble in securing men are the yards where they are not paying sufficient wages. Several reports have been circulated here to the effect that the Government intends to commandeer all the available scrap, but this report is denied almost as quickly as it is put in circulation.

Pittsburgh.—The stocks of scrap in the yards of dealers here are reported to be very low and in some cases entirely exhausted. Large orders are not coming into the yards here at all, as it is explained in many cases all the scrap is being used in the district where it originates.

Buffalo.—The opinion of many of the large scrap dealers here is that the labor problem is the biggest thing they have to go up against at the present time. Not only are the yards handicapped by the lack of men but the consumers say that they have not sufficient help to handle the scrap when it comes to them. Many of the dealers are not able to classify and sort the stock as it comes to them and because of this they are not able to pass it on quickly to the trade. In fact some tonnages of scrap have been refused in this locality lately because there is not the labor supply to deal with them.

Cleveland.—Heavy melting melting steel is in particularly heavy demand here just now but the supply is no better than before. There appears to be a very large stock in the yards of some of the dealers but is of a miscellaneous character and requires a very great deal of handling and sorting of a more or less skilful character before it can be placed on the market. Some of the dealers say that with a new 25 per cent. increase in freight rates they are losing money on contracts that were figured on a rather narrow margin.

St. Louis.—One thing that is very noticeable in the scrap supply situation here is that railroad offerings are becoming very scarce. In fact in some cases they have almost reached the point. This week there were hardly any lists at all from the transportation companies and it is not likely that any will be sent out in the near future. Since the Government took control of the railways there is a tendency as a matter of policy on their part to sell all scrap direct to the consumers, and dealers claim that in this way they are being eliminated from the transaction. Reports from American points would also seem to indicate that there is a very acute situation in the sheet steel markets. Many of the salesmanagers for the large concerns know quite well that the jobbers are in dire need of all grades of sheets. The jobbers are lo wbecause supplies to them have been curtailed very materially during the last 60 days.

Other reports claim that in the Pittsburgh district the mills are showing a further decrease in sheets. It is estimated there that the output does not exceed 55 per cent. of the capacity.

Report from Chicago claims that the extreme heat during the past fortnight has had some effect in reducing the output of the sheet mills.

GAS MASKS

GOVERNMENT experts of all countries are constantly trying to develop means of protection against poisonous gases, against which the men have to battle daily. Masks of all types are used continually in most attacks. Our photo shows the masks now used by our Allies and the enemy. From left to right they are: American, British, French and German masks.

Immediate Delivery on Four New Montreal Boring Lathes with Air Chucks and Steel Collets

75-Six Inch Shells in Ten Hours

Is the record for Rough Turning made on the Montreal Lathes built by us—and they are doing it right along.

Here's the reason

All Steel Gears
Increased Belt Speed
Ball Thrust To Spindle

We have introduced a number of worth-while improvements. Let us tell you about them.

The A. R. Williams Machinery Co.
Limited
64 WEST FRONT ST. TORONTO, CAN

STANDARDIZED MACHINERY AND ITS BEARING ON BRITISH OUTPUT

In the efforts of the government to cope with the urgent need for an increased output of shipping, the standardization of the auxiliary and propelling machinery for merchant ships naturally followed upon the adoption of the policy of building standard hulls.

It was considered that the best method of securing rapid output was to adopt the tried designs of firms accustomed to producing the merchant ship class of machinery and to appoint one firm to act in a leading capacity for each different size of machinery. That is to say, all the designs for each class of engine, with the exception of the small pumps, &c., were prepared by one firm, and issued complete to the various machinery contractors, together with full specification of all the raw material, orders and finished items which were to be obtained from sub-contractors.

New Patterns Obviated

The drawings an information issued by these leading firms were very complete, much more so than is usual, so that even firms who were not familiar with such work would have no difficulty in knowing exactly what was required. In this way the labor in other drawing offices was reduced to a minimum. As all firms were working to one design, it has been arranged in many cases that firms do not make new patterns, but obtain the use of those already made by another firm. thus reducing labor and conserving the special timber required for pattern-making.

The Advantage of Standardized Parts

With standardization, materials such as shafting, auxiliary machinery, pumps, valves, fittings and piping can all be manufactured in large quantities, and thus the fullest advantage is taken of duplication and of the available reserve in plant and labor. Moreover, in the event of a firm falling behind with the construction of machinery for a particular hull, a replace set can easily be transferred from another source, and so the delay in completion that must have been incurred had each builder been building to his own designs and sizes is avoided.

The first size of machinery adopted was capable of developing about 2,500 i.h.p. under normal conditions, and about 3,000 h.p. for a short period in an emergency.

The standard designs adopted were prepared and issued to the machinery contractors within a few weeks of the instructions being issued to the leading firms, and the first vessel fittde with standard engines was ready for sea within eight months of the order for her being placed.

Extension of the Scheme

The programme has now been extended to include larger vessels with a greater power, and also smaller vessels down to the coaster size. Even so, however, the number of different types of engines constructed has been kept down to theh minimum. They do not exceed half a dozen, as engines of the same size are being fitted in many different types of vessels, which are built specially to suit particular trades.

Experience has now proved the very real advantages of standardized machinery. For instance, engines and boilers have frequently been transferred from one firm to another in order to expedite delivery. Again, in many cases where engines and boilers have been damaged by enemy action, they have been replaced without loss of time by standard engines and boilers ready to hand, thus greatly expediting the completion of repairs, which would have taken longer if it had been necessary to await the construction of a new engine and boilers.
gine has been sent from one firm to an-

In many cases, too, a part of an enother to expedite the completion of a particular set of machinery.

Another very great advantage accrues from the standardization of the smaller parts of machinery. As each of them is reproduced without the slightest variation, the subcontractors can work continuously and produce them in large numbers. There is, therefore, no delay in delivery when they are needed, whereas with the old methods, although such parts differed only in very small points, to suit the needs of individuals, the difference was sufficient to prevent them being used for the first firm requiring delivery.

Utilization of Inland Firms

Perhaps one of the most important advantages of the standardization of merchant ship engines is that it has enabled the labor and plant of a number of inland firms to be utilized in a manner which would not otherwise have been possible. A large number of the inland firms whose works were suited for heavy work of this nature are now making standard engines, thus utilizing labor and plant which might otherwise have been standing idle, and at the same time relieving the pressure on the regular marine-engine building firms.

A further development, with a view teo increased output, has been the grouping of firms into classes, each of which concentrates its efforts on a few sizes of machinery best suited to its workshops and plant. This enables these firms to go in for repetition work extensively, and attain a very high output.

The Potentiometer System of Pyrometry and Temperature Control is the title of a 60-page, 8 x 10½ in. catalogue, published by the Leeds & Northrup Co., of Philadelphia, to describe a system of pyrometry and temperature control in which the potentiometer method is employed for measuring the electromotive force of thermocouples. A known electromotive force is included in the circuit with the thermocouple, and by varying the known electromotive force, the current can be varied until a galvanometer, also in the circuit, indicates that no current is flowing. When this ahs been done, the thermocouple electromotive force is, of course, equal to the known electromotive force. Due to the fact that no current flows at the moment of measurement, changes in the resistances of lead wires, thermocouples, galvanometers, etc., are eliminated and do not affect the result. Bay making the lead wires of the same material as the thermocouple, the "cold junction" of the latter is brought back to the instrument where its effects can be compensated for automatically. The variable electromotive force is obtained by a moving contact along a slide wire through a standardized current is flowing. This may be done by hand, as in potentiometer indicators, or by mechanical power as in the Leeds & Northrup Recording Potentiometers. In these instruments the galvanometer acts merely as a trigger or pilot. When deflected, the boom is forced by reciprocating parts against other parts which mechanically adjust the slide wire contact, the amount of adjustment depending upon the amount of deflection. When no current is flowing the boom stands at the neutral position and there is no adjustment. It is thus possible for a delicate and sensitive galvanometer to control the expenditure of a considerable amount of power. This fact has been taken advantage of to construct curve-drawing and multiple-circuit printing recorders, and also to operate signal lamps and indicators at the furnaces. The recorder thus takes the place of an attendant, who would otherwise be required to read the pyrometer and to signal its indications. The potentiometer is also applied to a special apparatus for the location of the thermal transformation or recalescence and decalescence points of metals. The Leeds & Northrup Co. has developed an apparatus by which temperatures are plotted as ordinates and temperature differences between the sample and a non-recalescing body on a magnified scale as abscissae. This shows the transformation points graphically, as the temperature of the non-recalescing body continues to change.

TRADE INQUIRIES

The following trade inquiries have been received by the Department of Trade and Commerce, Ottawa. Further particulars may be obtained from the "Inquiries Branch" of the department.

482. Motor-car Accessories.—A Liverpool firm of motor accessory factors would like to hear from Canadian manufacturers of motor-car accessories with a view to post-war business.

483. Asbestos Fibre.—An English firm, considerable importers of absestos fibre, ask to be placed in touch with exporters, with a view to post-war business.

484. Padlocks.—An English firm would like to hear from exporters of padlocks with a view to post-war business.

A NEW 24" PLAIN TURNING LATHE

Designed and Built specially for
Plain Turning operations and for
Rapid Reduction of surplus stock

Main Features

Steel Gears (Headstock and Apron)
Enclosed Headstock (Patent Applied for)
Gears and Bearings Run In Oil
Ball Thrust to Spindle
Large Wearing Surfaces

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

ENGINEERING

Hamilton, Ont.—The Ford-Smith Machine Co. have taken out a permit for the erection of a factory building to cost $30,000.

Vancouver, B.C.—Plans are in progress for an engineering plant for the Robertson Iron Works. Manager, Fred. V. Robertson.

Owen Sound, Ont.—The Booth Fishing Co. contemplates the enlarging of docks and the building of a freezing plant and warehouse.

Beaver Cove, B.C.—The Beaver Cove Lumber & Pulp Co., are erecting a pulp mill and have completed survey for a waterpower plant.

Brantford, Ont.—The Motor Trucks, Ltd., are building a $12,000 brick boiler house, and have let the roofing contract to Turnbull & Cutcliffe, Brantford.

Brampton, Ont.—Tenders are being received by the clerk, A. G. Davis, until 6 p.m., August 12, for the reconstruction of a sewage disposal plant for the Town Council. Plans and specifications are with the engineer, W. M. Threadgold.

Lachine, Que.—Plans and specifications have been prepared by the architects, Brown & Vallance, 12 Bleury street, Montreal, who will receive tenders until August 8 for the erection of a manufacturing plant for Crane Company, 836 South Michigan Ave, Chicago, Ill.

Niagara Falls, Ont.—Niagara Falls has landed a new industry in the National Abrasive Co., of Boston. Construction of the plant will begin at once. The company located a branch at Hamilton, but not being able to get five thousand horse-power needed, had to sell out there, and the Ontario Hydro has promised them the needed power in this city. The new plant will be in operation by November.

Toronto, Ont.—Tenders will be received by the chairman, Board of Control, City Hall, Toronto, up to noon on Tuesday, August 20, 1918, for the supply and delivery of: Tender No. 41 (Recall) liquid chlorine; No. 44, water meters; No. 45, waggon loader. Envelopes containing tenders must be plainly marked on the outside as to contents. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

Ottawa, Ont.—Tenders will be received until noon, August 10, 1918, for the structural steel pipe bents required in the construction of the central heating plant of this building. All tenders shall be based on the supplying, fabrication and delivering to the site of some one hundred and seventy (170) pipe supports and nine (9) anchor bents as required and described by the plans. Plans and any other information required can be obtained at the office of the general contractors, P. Lyall & Sons Construction Co., Ottawa.

Toronto.—The D. W. Mitchell Company, of Toronto, has completed an agreement for the erection of a $45,000 mausoleum in St. Thomas cemetery within the next year. The building, approximately 130 x70 feet, will be of the most lasting type of construction known. Bedford stone on the outside and polished marble throughout the interior, no wood whatever to be used.

Halifax—The Novia Scotia Car Works plant under the direction of the Halifax Relief Commission is probably the busiest place in Halifax to-day. At least 370 men are employed in the plant and it is the supply base for all the reconstruction workmen. Everywhere is unmistakable evidence that brains, energy and the most modern machinery and tools are being effectively applied to the rebuilding of devasted Halifax.

Ottawa, Ont.—Tenders for the placing of stone protection on the summit level of the Welland Canal between Thorold and Port Colborne will be received until 12 o'clock noon on Friday, August 9, 1918. Specification and form of contract to be entered into can be seen at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Superintending Engineer, St. Catharines, Ont.

Toronto, Ont.—A permit has been issued to the British Forgings Co., Ltd., to erect a heat-treating building on Commissioner street at a cost of $12,000.

Quebec, Que.—The workshops of the Quebec Railway, Light and Power Company, at St. Anne de Beaupre, were practically destroyed by fire last Thursday. The blaze broke out in the old shops and spread to the round-house, which was also destroyed. Three freight cars and a passenger car were destroyed.

Ottawa, Ont.—Tenders will be received until August 8, 1918, for the hydraulic elevator equipment required in the construction of the central heating plant of the Parliament Building. All tenders to be based on the supplying, erection, installation and completion, together with the furnishing of all material, tools, appliances, labor, etc., necessary and described by the plans and specifications for the hydraulic elevator equipment. Plans and specifications, and any other information required can be obtained at the office of the general contractors, P. Lyall & Sons Construction Co., Ottawa.

GENERAL

Port Coquitlam, B.C.—Plans are in progress for a woodworking factory for A. W. Keith.

Drummondville, Que. — The Drummondville Match Co. will erect a $100,000 match factory.

Bagotville, Que.—Ponliot Co., Ltd., will erect a $25,000 saw mill. Manager, R. E. Joron, Chicoutimi.

Brantford, Ont.—The Brock Woolen Co., are building another addition to their factory, 42 by 156 feet.

Toronto, Ont.—The Corrugated Paper Box Co., 187 Geary Ave., will erect a $5.500 addition to their plant.

Prince Albert, Sask.—P. Burns & Co., head office, Calgary, are erecting a $100,000 abattoir and packing plant.

Toronto, Ont.—The Ideal Bread Co. will extend its plant at 183 Dovercourt road. A building permit has been issued.

Drummondville, Que.—J. A. Nadeau has the general contract for $100,000 match factory for the Drummondville Match Co.

Dollarton, B.C.—Plans are being prepared for the Vancouver Cedar Mills, Ltd., for alterations to saw mills costing about $5,000.

Toronto, Ont.—The Gutta Percha & Rubber Co. has been granted a permit to make alterations to its factory on O'Hara street.

St. Jerome, Que.—The Regent Spinners, Ltd., St. Marie street, will erect a $40,000 brick factory. Assistant superintendent, P. Bureau

Carleton Place, Ont.—The Lee Hotel property near the railway tracks has been purchased by Mr. C. Harrold. He has made alterations in the building and has installed machinery for the manufacture of pulley belts and endless belts for driving light machinery. Already production in a small way has been commenced.

MUNICIPAL

Newcastle, N.B.—The erection of a $125,000 electric plant is contemplated by the Light and Water Commission, City Council.

North Bay, Ont.—Tenders will be called by the engineer, H. J. McAusland, for the erection of a $10,000 pumping station for the Town Council.

Guelph, Ont.—The City Water Commissioners contemplate the installation of an auxiliary pumping machine costing

about $16,000. Engineer, F. McArthur.

Lauzon, Que.—Plans are being prepared for a waterworks system costing $10,000 for the Town Council. Edouard Hamel, 21 St. Peter street, Quebec, is the engineer.

Woodville, Ont.—A by-law will be submitted to the ratepayers on August 19 to sanction an expenditure of $1,500 to provide for the cost of completing plant for the distribution of hydro-electric power. Bonds to be 6 per cent., 20 instalments.

Rainy River.—The Rainy River Electric Light Co's. entire system, including two engines, two boilers and five dynamos housed in a cement power house, is up for sale. The ratepayers of the town are to vote for or against the purchase on August 12. If the by-law does not carry, it is intimated that a private company will acquire the plant.

Scarboro, Ont.—The Scarboro hydro power line, under construction since last fall, has been completed, and the power has been turned on at Agincourt, the terminus of the line. Over 125 meters have been installed and Geo. Green, secretary of the Hydro Commission, expects that this number will be doubled before long. Street lights at Agincourt will be burning within a few days, 24 lamps having been installed at 300 feet apart.

Brantford, Ont.—According to the report of the Special Gas Commission, Brantford has offered to build a purification plant at a cost of $40,000, to be rented to the Dominion Company, the price of gas not to be raised beyond 60 cents per 1,000 cubic feet. A counter-proposal has been advanced by the company that the city guarantee unsold bonds to the extent of $65,000, the money to be spent in completing the company's central purification plant at Glenwood. The company has asked the city to wait one month, when, it claims, purification will be successfully accomplished.

TRADE GOSSIP

The question of the Canadian Government's acquisition of the Grand Trunk has been further discussed with Alfred Smithers, the chairman.

Halifax Shipyards, Ltd. Head Office.—The principal office of the Halifax Shipyards, Limited, will be located at 286 St. James street, Montreal.

Imports from the United Kingdom, France, Italy and European neutrals decreased. England lost more than $100,000,000, France $33,000000, and Italy $16,000,000.

It is felt if other yards are authorized to engage in the construction of steel ships the plans of the Federal government will be more or less seriously interfered with.

Nova Scotia Steel Co. Ratifies Appointment.—The directors of the Nova Scotia Steel & Coal Co. have ratified the appointment of D. H. McDougall as president of the company.

Imports from European Russia showed an increase of almost $10,000,000, totalling $15,146,826, as the result of large quantities of hides and platinum being brought out early in the year.

U.S. Import Trade Shows Increase.—Imports in the fiscal year ending June 30 were $2,946,059,402, an increase of $287,000,000 over the previous year; figures issued to-day by the Department of Commerce, Washington, show.

Mr. Ballantyne had several meetings with the British Ministry of Food in reference to the purchase of Canada's available food products of all kinds, required by the allies. There is every likelihood that arrangements of a satisfactory nature will be completed before his departure homewards.

Every preparation is being made for extensive operations. Large machine shops have been built where the latest machinery has been installed ready to be operated when required. Their hoisting equipment is also of the latest type, capable of handling a very large output.

Heavy Call for Steel in U. S.—Steel requirements of the United States Shipping Board for the next three months call for 1,000,000 tons, an increase of 250,000 tons over the regular monthly schedule for that period. This increase is desired so as to provide a reserve of 1,330,000 tons by November.

Canada, with $434,254,567, led foreign countries in the value of goods sold to the United States. Grain and nickel constituted the bulk of the trade. Imports from Cuba increased more than $9,000,000, while those from the British East Indies increased $70,000,000 to $296,606,000, largely due to heavy shipments of tin and jute. Japan also increased its shipments, particularly of silks, rice and cotton goods.

Ship Wheat by Erie Canal.—G. A. Tomlinson, general manager of the New York Canal System of the Federal Railroad Adminstration recently stated that, after mid-August, European bound wheat from the middle West, now shipped by way of Canada, will be brought through the Great Lakes and the Erie Canal and put aboard trans-Atlantic vessels at the port of New York.

The 20% increase in freight rates came as an unpleasant surprise to shippers throughout Canada. It falls as an extra heavy burden on manufacturers who secure raw materials from the United States as it is additional to the advance of 25% that went into effect on American roads little more than a month ago. It is thought in some quarters that a request for a stay in the application of the higher tariff will be made.

To escape double income tax, Americans working in Niagara Falls, Ontario, and living on the American side, recently held a meeting at which it was decided to send a delegate to Washington. It is probable that a delegation will also be sent to Ottawa in an endeavor to have the governments of both countries arrange a fairer deal for both Canadians and Americans. It was felt that only the country where the money was earned should receive the tax.

Steel rails originally ordered by Russia in the United States have been purchased by the Canadian Government. Already 30,000 tons have been delivered to the Department of Railways and Canals and 10,000 tons more are coming These rails are being laid for sidings along the Transcontinental and Intercolonial Railway, replacing heavier 80 pound rails which are being taken up and used for repair work on the main lines of the government system.

Granby Does Extensive Work at New Coal Mines.—The Crosby Company are pushing ahead the development of their recently-acquired coal property near Cassidy's Siding, Vancouver Island, and already have two slopes in operation, both producing coal. They have already gangs of men working , clearing a right-of-way to connect the property with the sea near Ladysmith, where wharves and bunkers will be built in the near future for the purpose of conveying coal by steamship to the large smelter at Anyox, where it will be manufactured into coke for smelting purposes.

Customs Receipts Decline.—A decrease of $4,876,864 in the customs receipts for the first four months of the fiscal year, as compared with the same period in 1917, is shown by the monthly statement issued from the Customs Department, Ottawa, last Thursday. For the four months ending July 31, the total receipts were $56,072,983, while on July 31, 1917, they were $60,949,847. The decrease for the month of July, as compared with July, 1917, is $684,663. During July, 1917, the customs receipts totalled $14,269,643, while for July in the present year, the total was $13.584,980.

The shipper pays for "tracing" in future.—An order in force in the United States and now adopted by the Canadian Railway War Board aims to reduce the heavy volume of work of tracing shipments by placing upon the person inquiring the cost of telegraphic inquiries and replies. Hereafter messages to shippers will be sent collect and messages going out must be prepaid. It is understood that enforcement of this order is necessary owing to a shortage of operators and that so far the Railway department of the Canadian Manufacturer's Association has had no complaints from shippers.

Sherbrooke Firm Changes Name.—The business, which has been operated for the past nine years under the name of MacKinnon, Holmes & Co., Ltd., Sherbrooke, P.Q., is now being conducted under the name of MacKinnon Steel Co., Ltd., the change having been made last week. The company, of which J. W. Bowman is president, George D. MacKinnon vice-president and general manager, and F. C. Johnston, secretary-treasurer, is engaged in the business of fabricating all classes of structural steel and steel plate work.

Effect of Air Pressure.—Even a large steel oil-tank will not stand up against an atmospheric gas attack. Such a tank, with a capacity of 8,085 gallons, was being overhauled in San Francisco. It was planned to refill it with cocoanut oil;

LENOX *"The Blade in the Plaid Box"* LENOX

You Get the Best When You Buy—

"LENOX" HACK SAWS

The quality that goes into "Lenox" Hack Saws is your guarantee of uniformity and all round satisfaction. They are made by a firm whose experience has been that of years in the matter of perfecting blades, that would bring success and fame to their makers. One trial order will convince you that they have succeeded—*besides "Lenox" saws cost no more—and are worth much more.*

Free Sample Blade

We will send you a blade *free of charge* if you will write and tell us size, and material on which the saw is to be used.

AMERICAN SAW & MFG. CO. HACK LENOX SAWS SPRINGFIELD, MASS. U.S.A.

Send Your Name for Booklet

The "Blade in the Plaid Box," is the title of a bright, informing little booklet issued by the makers of Lenox Saw Blades and which we will mail you on receipt of your name and address.

The Best is the Cheapest in the End

Lenox Blades are the nearest automatically manufactured Hack Saws now on the market, being made under a new process, combined with machines of exclusive design which with a perfected system of hardening and tempering guarantees absolute uniformity.

We can supply you and make immediate delivery of Hack Saw Blades for hand frames, light and heavy power machines. Price lists sent by return mail on request.

"The Saw of Efficiency—The Saver of Time"

The Canadian B. K. Morton Co., Limited

but it first was cleaned out by steam, a valve in the bottom being opened to permit the refuse to run out of the tank. When the steam condensed a partial vacuum was created, which was enough to permit the atmospheric pressure (14.7 pounds to the square inch) to crush the sides of the tank as a large stone by its impast might damage a small tin can.

Wooden Shipbuilding Record.—Canada now holds the record for speed in wooden shipbuilding on the American Continent. The feat was accomplished by the Quinlan and Robertson Shipbuilding Co. of Quebec in the construction of the "War Seneca," a wooden steamer. This vessel was launched on June 13 and a dock steam trial was made last Friday—just 48 days later—by turning over the main engine and auxiliaries under steam. This is six days better than the previous best made in the United States, which is said to have been 54 days. This boat was built for the Imperial Munitions Board.

Independent Tool Co's. New Offices.—The Independent Pneumatic Tool Co., have leased the entire sixth floor in the Otis building, at 600 W. Jackson Boulevard, Chicago, Ill. This space contains 12,000 square feet and will be occupied by the lessee company for their general offices. John D. Hurley, president of the company, stated that the great demand for pneumatic tools for government work and shipbuilding had forced his company to seek larger quarters. The space now occupied at 1307 S. Michigan Avenue contains 6000 square feet, while the new quarters provide just double this area. Removal into the new quarters will be effected about September 1.

Ten Aeroplanes per day is Canada's record since early in 1917. It is a record to be proud of, all things considered, the least of which is not the fact that the timber used—silver or Sitka spruce—comes from the distant British Columbia coast. Turning out this timber of finest grain are more than 60 logging camps and many saw mills. In this connection it is interesting to note that the 50,000 foot capacity mill of the Nasmyth Lumber Company, which was to have been installed on the site of the old Cypress Lumber Company, West Vancouver, will not be put on the local property until the Imperial Munitions Board has finished using it in the northern spruce claims.

Manganese Ore from British Columbia.—Shipments of manganese ore have begun from the deposits 6½ miles from Kaslo, British Columbia, on the Kaslo and Nakusp branch of the Canadian Pacific Railway. It is apparently a surface deposit covered by from 6 in. to 2 or 3 ft. of earth. The output is about 25 tons per day and is being shipped to the United States. There appears to be a considerable body of ore, estimates varying all the way from 2500 tons to 12,000 or 15,000 tons. The assay of the first car shipped follows: Moisture, 25.33 per cent; manganese, 39.65 per cent; iron, 4.40 per cent; silica, 10.98 per cent; phosphorus, 0.0074 per cent.

Discarded Machinery Wanted.—Many of the mining companies of the Cobalt district, which have machinery that has become second-hand or been replaced by more modern equipment are finding a growing demand for their discarded equipment, owing to the great increase in the price of new mining machinery of all kinds. Another feature which makes desirable the purchase of the equipment in the district is the fact that delivery of material over the railroads has become a source of much worry and waiting. A number of the mines in the district are having their discarded machinery overhauled and placed in a marketable condition, and in many cases this equipment is fetching a higher price than that paid for it when new several years ago.

Will Build More Ships at Vancouver.—A despatch from London, England, states that a number of prominent shipbuilders, including Sir William Beardmore, called on Hon. C. C. Ballantyne, Canadian Minister of Marine, with reference to shipbuilding in Canada. The result of the interview has been the granting of permission for a company to undertake the construction of twenty wooden vessels at Vancouver for Norwegian registry. Numerous applications have been received to build steel ships in Canada for either Allied or neutral registry, but these have been consistently refused owing to the fact that the Dominion government has launched a shipbuilding programme of its own, for which it is difficult to secure the necessary ship plates.

Will Investigate Fatigue of Metals.—The National Research Council, acting as the Department of Science and Research of the Council of National Defense, has appointed a committee to investigate the fatigue phenomena of Metals. Professor H. F. Moore of the Engineering Experiment Station of the University of Illinois is chairman. The Committee is charged with the responsibility of developing a knowledge of the strength and durability of metals subjected to repeated stresses, such as ship structures, crank shafts of aircraft engines, and heavy ordance. It is expected that much of the experimentation required will be done in the laboratories of the University of Illinois at Urbana under the personal direction of Professor Moore.

Canadian Produces Metal for Cutlery.—A metal suitable for the very finest forms of cutlery has been developed from combining iron, chromium and cobalt, according to an announcement made by Professor W. L. Goodwin, of Queen's University, Kingston, Ont. United States consul, F. S. S. Johnson, who is at Kingston, reports that the new metal is easy to work and is shortly to be put on the market in commercial quantities. Prof. Goodwin is chairman of the Canadian section of the Society of Chemical Industry, which organization, in conjunction with the Canadian Chemists and Chemical Engineers, is working toward getting a higher degree of extraction of useful substances from ores and finding new uses for waste products. Canadian chemists were reponible for the discovery of the new metal, which is peculiarly a Canadian product.

Tire and Wheel Plant in Montreal.—The formal opening of the tire and wheel plant, the latest unit of the Armstrong-Whitworth Co. of Canada, Ltd., took place last Thursday at Longueuil in the presence of a numerous delegation of railway and steel men, who declared at the close of the ceremony that the comparatively cheap supply of electricity would, in the near future, make Montreal the manufacturing leader of this continent. The tires to be turned out at the Longueuil plant could not have been secured several years ago outside Germany, while the United States have been supplying the article for the whole of the American Continent since the beginning of the war. The unit of the Armstrong-Whitworth works opened on Thursday, therefore the first of the kind in the Dominion, hence the importance of the occasion to the manufacturing element and the railways of the Dominion. The plant has a total area of 400 acres, a considerable portion becovered by the new works.

The Canadian Engineering Standards Committee, formed recently in Montreal, may do much to further economic production in Canada and to harmonize British and American practice. To secure interchangeability of parts, to cheapen manufacture by the elimination of waste entailed in producing a multiplicity of designs for one and the same purpose, to effect improvement in workmanship and design, and by concentration rather than by diffusion of effort, to expedite delivery and reduce maintenance charges and storage, are its primary objects. The committee is constituted with official representation from the departments of the Government, the Canadian Manufacturer's Association and important technical organizations. At the organization meeting Sir John Kennedy, dean of the enginering profession in Canada, was unanimously appointed chairman and P. H. Vaughan and Capt. R. J. Durley, vice-chairman. Dr. John Bonsall Porter was elected honorary secretary-treasurer, and Frank S. Keith, secretary. The Engineering Institute building, 176 Mansfield Street, will be used as headquarters.

PERSONAL

John Livingston, of Montreal, who for several years was connected with the Dominion Bolt Works, Toronto, Ont., died recently at the age of 79. He was regarded as one of the leading iron experts of Canada.

Terrell Croft, consulting electrical engineer of St. Louis, has been called to Washington by the educational committee of the War Department to assume charge of the work of standardizing the electrical courses of training for enlisted men.

F. W. Gray has severed his connection with the Dominion Steel Corporation and has left Sydney for New Glasgow. It is understood that Mr. Gray will probably

For Sale at a Bargain

Rand Class "B-1" Air Compressor

Duplex Steam, Duplex Air. Steam Pressure, 80 to 100 pounds. Air Pressure, 80 to 100 pounds. Cylinders 8 inches x 12 inches. **Requires 40 to 46 Steam Horse Power for Full Working Load.** Used by us for three or four years, giving good satisfaction; but as we now use electric power instead of steam, we have no further use for this machine. Write us for full particulars.

This Compressor cost us $1,700 New before the war. We are now offering it at considerably less than half this price.

join the staff of the Nova Scotia Steel & Coal Co. Mr. Gray has been attached to the Dominion Steel Corporation since 1904. He is a graduate in mining from Sheffield, England, university, and is a member of the Institute of Mining Engineers, London. He is also a member of the Council of the Canadian Mining Institute.

MARINE

Prince Rupert, B. C.—A contract has been closed for the construction of five steel ships of 8,500 tons each, and preparations for their building are already underway at the shipbuilding plant of the Grand Trunk Pacific.

Levis, Que.—A syndicate of several shipbuilding companies of the Dominion ma yshortly form a s syndicate and erect a $1,500,000 plant. Dussault & Hutchison, Commercial street, Levis, Que., are interested.

Vancouver, B. C.—The launching of the War Suquash at the North Shore yard of the William Lyall shipyards, on July 24, marked the completion of the contract between the Lyall Company and the Imperial Munitions Board. Within the last five months the company has launched six vessels and is now building six schooners to its own order.

Truro, N. S.—Two well-known Truro lumbermen, Messrs. McLean and McKay, with large timber limits at Economy, Colchester Co., have engaged in shipbuilding operations. Nearing completion in their shipyard at Central Economy they have a fine three masted 400 ton schooner of 23 foot beam, 136 foot keel and 12 foot depth of hold.

Victoria, B.C.—Contracts have been actually placed with one of the well known shipbuilding companies for the construction of twenty wooden vessels in Victoria, and the Provincial Government has granted an option for a few days on a site situated on the Songhese Reserve. This is the substance of an announcement made by Hon. John Hart, Minister of Finance, recently.

Sarnia, Ont.—The big lake freighter William A. Rogers, when opposite the city on the night of July 29, groke her steering-wheel and, before she could be stopped, crashed into the Northern Navigation wharf. Backing out under her own power, she lost her propellor. In charge of the wrecker Manistique and two tugs she continued on her way to a Lake Erie port, where she will be drydocked for repairs after her cargo of iron ore has been taken off.

Cote St. Paul, Que.—On July 27 the "War Ottawa," a 3,100 ton dead-weight wooden ocean-going vessel, took the water at the yards of the Fraser, Brace Shipbuilding Company. Col. W. I. Gear, director of shipbuilding for the Imperial Munitions Board, presented loftsman Placide Drapeau and general foreman William Lalonde and Geo. Grey each with a ring in recognition of their splendid service in connection with the building of the "War Ottawa."

Fort William, Ont.—The envy of five sister ships in various stages of construction in adjacent berths, the Wauarin, first of the French mine sweepers constructed at the plant of the Canadian Car and Foundry Company, moved to her maiden dip on July 29. Within 30 minutes after she started towards the slip, the keel of a seventh mine sweeper was laid in her place. The Wauarin will have her boilers installed at the docks, her guns placed fore and aft, her upperworks finished and go through a series of target tests on Thunder Bay all before she starts on her way down the lakes for the seaboard. It is understood that a second launching was to be made on August 7 and others soon after.

Port Greville, N. B.—The four-masted schooner Fredie E., on July 25, was launched from the shipyard of H. Elderkin & Company. Fitted with gasoline equipment for hoisting purposes and modern in every particular, she is a vessel of 669 tons register, 199 feet long, 36.9 wide and 19 feet deep. From Port Greville the Fredie E. goes to St. John to load lumber for Durban, South Africa. Construction on another schooner of about 275 tons is to be started at once, so as to have her ready for the water before the close of navigation this fall. This vessel will be built on the co-operative plan, the workmen taking shares at first cost and sharing in any profit realized from her sale.

Vancouver, B. C.—Difficulties beeween masters and mates and the steamship and tugboat companies operating on the Pacific Coast came up for investigation under the Industrial Disputes Investigation Act two weeks ago, the commission of enquiry consisting of Messrs. W. E. Burns, chairman; J. H. McVety, for the Canadian Merchant Service Guild; and E. A. James for the companies. The men demand recognition of their organization and higher wages. Nineteen or twenty of the companies, it is understood, have accepted the wage schedule issued by the guild, but the C. P. R., the G. T. P. and the Union Steamship Company claim they have no dispute with the men and refuse to deal with the guild in any way.

CONTRACTS

Montreal.—The Foundation Co., Ltd., Bank of Ottawa Bldg., have the excavating contract for factory extension for the Canadian Rolling Mills Co.

Quebec, Que.—The general contract for construction of water main costing $7,000 has been given to the Canada Iron Foundries, Ltd., of Three Rivers.

Cornwall, Ont.—The Hydro--Electric Commission have placed with the A. B. Ormsby Co. the contract for the rolling steel doors required on the new power house.

Hamilton, Ont. — The Pigott-Healy Construction Co., of Hamilton, Ont., has been awarded a contract for the new addition to the Beaver Board plant at Thorold, $100,000, a reinforced concrete building.

Brockville, Ont.—Contract for the new $250,000 college for the congregation of the Most Holy Redeemer has been

awarded the Pigott-Healy Construction Company, of Hamilton. The new building, entirely of stone will stand on the banks of the St. Lawrence River and will be one of the finest of the kind in Canada.

TENDERS

Ottawa.—Tenders for the construction of temporary barracks, Barriefield, Kingston, Ont,. will be received at the office of R. C. Desrochers, Secretary, Department of Public Works, Ottawa, until 12 o'clock, noon, August 14, 1918. Plans can be seen at the offices of the Chief Architect, Department of Public Works, Ottawa, the Resident Architect, Kingston, Ont., and the Clerk of Works, Postal Station "F," Toronto. Each tender must be accompanied by an accepted cheque, payable to the Minister of Public Works, equal to 10 per cent. of the amount of the tender.

Ottawa.—Tenders addressed to R. C. Desrochers, Secretary, Department of Public Works, Ottawa, will be received until 12 o'clock noon, August 14, 1918, for the construction of temporary barracks, Carling Heights, London, Ont. Plans can be seen at the office of the Chief Architect, Department of Public Works, Ottawa; the Caretaker, Post Office Building, London, Ont., and of the Clerk of Works, Public Works Office, Postal Station "F," Toronto. Each tender must be accompanied by an accepted cheque, payable to the order of the Minister of Public Works, for 10 per cent. of the amount of the tender.

CATALOGUES

Grinding and Polishing Machines.—St. Louis Machine Tool Co., St. Louis. Two circulars. The first illustrates and describes the Western line of grinding machines which are made in 11 different types. Illustrations of the various accessories that can be supplied are presented also. The other circular points out the advantages of the special type of ball bearing used with the company's polishing machines. The different machines making up the complete line are illustrated, and a condensed table of specifications is included. There is practically no text in the circular, reliance being placed upon the illustrations to tell the story.

Coke Oven Machinery.—Wellman-Seaver-Morgan Co., Cleveland. Bulletin No. 10. Describes the important features of some types of this company's coke oven machinery. The text is supplemented by illustrations showing an installation at the plant of the Indiana Steel Co., which includes a combined coke pusher, coal leveler and door extractor for use with Koppers by-product ovens. A combination coke pusher and coal leveler for Semet-Solvay ovens, types of door lifters for Koppers ovens and a coal charging larry for by-product coke ovens are also shown.

After the War—What?

The time to put on fire insurance is before the fire. The time to prepare for after-the-war-conditions is before peace comes.

Advertise now your facilities for making special machinery, fine tools, etc., in this section of CANADIAN MACHINERY.

National Tariff Commission Proposed to Consolidate Canadian Prosperity

"UNTIL the tariff question is taken out of politics Canada is in danger of being divided into two camps. Over the question of high tariff or low tariff two great groups of the builders of Canadian prosperity hold different views. Manufacturers and farmers of the Dominion are divided on this vital matter and business men, wholesalers, retailers, and others who are neither manufacturers nor farmers are closely concerned."

Constructive Plan to Bridge Perilous Gulf

"The difficulty," says THE FINANCIAL POST, "is that the gulf between the opposing interests is being widened by the very efforts which have been planned to bring them together. It has been proposed that there be a conference of Eastern and Western interests at which the matter may be talked over in a business way. . . Such a conference will avail little if there is not set down for consideration some definite constructive policy. . . . THE POST'S idea is to have the Government appoint a commission of, say, seven members, two to represent the agricultural or low tariff interests, two to represent manufacturing or high tariff interests, two to represent workmen, with the chairmanship in the hands of an independent authority. . ."

An Editorial Feature of an Outstanding Issue

These brief quotations from the leading article in the Annual Government and Municipal Number of THE FINANCIAL POST now on sale give but a glimpse into an immensely important contribution to Canadian business plans for after-the-war prosperity. Read this powerful editorial in its proper setting amongst the vitally important business news of the Dominion at date—June 29th—dealt with under such heads as these:—

Transcontinental Freight Rates to Advance Aug. 1st
Canada's Outlook For New Capital From the United States
New Company Created to Operate the Ross Rifle Factory
Dry Weather Has Lowered Expectations as to the Crops
Farmers Accused of Gambling in Western Land Values
New Rules Now Govern Sales of Dominion Lands
Life Insurance as a Factor of Business Life
Remuneration Justified For Selling Victory Bonds

These are only a few of the principal subjects of articles in this issue apart from the comprehensive special matter it contains on the resources and financial standing of the Dominion, the Provinces and municipalities with all important factors bearing upon Canada's economic position at present. This issue of THE FINANCIAL POST OF CANADA is one to send for and keep. Write to-day for a copy of it, and decide at the same time to have a subscription to THE POST which costs $3.00 a year, and which as an investment will richly pay you. Use this form, or just sign it and pin your letterhead to it.

RICE LEWIS AND SON
LIMITED

ESTABLISHED 1834 TORONTO, ONTARIO 19 VICTORIA STREET

We carry a large and varied stock of fine measuring instruments and tools for tool room and munitions plant work, such as inside and outside micrometers, scales, calipers, depth gauges, pitch gauges, drills, reamers, hack saws and blades, mechanics' tool cases.

B. & S. Micrometers

Machinists' Tool Chests

For factory requirements we carry a heavy stock of Electric Light Bulbs and Electrical Equipment.

We will be glad to quote prices on receipt of inquiries

Is Your Product Used In Power Plants?

THERE is a man in every power plant whose influence is felt when a sale is made. Are you on good terms with that man?

Follow the line of least resistance—follow the example of firms who are successfully doing business in the power plant field, and cultivate the engineers through POWER HOUSE.

Ask the first ten engineers you run across just what they think of *their* paper. Their opinions will guide you to an advertising campaign in POWER HOUSE just as surely as though the publishers had directed you. Rates on application.

Make This Test In Your Shop

Set two men at an identical job.

Give one man a brand new file. Give the other man a half-worn file.

See how much time it takes for each man to finish his job.

The result will prove that it will pay you to instruct your mechanics to turn in files when they have passed their "efficient" point.

The "Famous Five" files stay hard and sharp because they are accurately cut and properly hardened. Specify them when ordering.

They are:

Production of Rare Quality at Lowest Labor Costs

There is unusual strength, accuracy, speed, convenience and range in

AURORA

Drilling Machines

You can use them to great advantage on HIGH EXPLOSIVE SHELLS or any work in your shop that's suitable for a machine tool of this kind. The operating is easy and the labor cost comparatively low.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

Oldest Portable Tool Manufacturers in America

The Grinding Machine of Many Uses

In your tool room there's external and internal straight and taper grinding to be done, cutters, reamers and tools to be sharpened and numberless other jobs on jigs, fixtures, etc., that can be handled quicker and to closer standards of accuracy on

Brown & Sharpe Universal Grinding Machines

FEATURES

Because all operating levers, wheels, etc., are at front of machine — rihtg under the operator's hands — quick setting up and rapid production are assured. Complete separation of speeds and feeds permits the most productive combination to be used. Automatic cross feed mechanism, simple to operate, positive in action and capable of accurate reduction of diameter of work in quarter - thousandth units, when desired. Universal Back Rests insure the correct support of work to maintain fast and accurate production.

We will gladly send you literature explaining in detail the many uses and many features of these efficient, "many-purpose" machines.

These machines are not limited to the tool room. Machine parts can be finished in quantities to advantage or the work of a general shop handled efficiently.

"Forbes Facts"

1. **One man can do the work of six against the old stock and die method of cutting.**
2. **It is the only machine on the market with receding gear.**
3. **It is self-contained and motor-driven.**
4. **It is portable.**

These are convincing arguments for the construction and utility of this machine. Thread cutting can be performed fast, clean and true. Equipped with self-centering vise.

The Curtis & Curtis Co.
115 Garden Street, Bridgeport, Conn.

VENUS PENCILS

THE army and navy man, the engineer, the mechanic---each must have his tools ***exact.*** To insure success they must not ***vary.***

VENUS pencils are exact in ***grade.*** The ***quality*** of VENUS pencils never changes.

VENUS PENCILS SET THE WORLD'S STANDARD

17 black degrees with or without eraser tips.
6B softest to 9H hardest
and hard and medium copying
all perfect.

FREE (EXCEPT Packing and Postage.)
Send 6c in stamps to cover actual cost of packing and postage and we'll send FIVE trial length VENUS Pencils and a VENUS ERASER

VENUS Erasers rub out cleanly and easily. 12 convenient sizes. Try them.

"You Will Yet Be Glad"

PRIVATE PEAT, who has sprung into fame through his books and extensive platform work, contributes an article to the August issue of MACLEAN'S MAGAZINE under the above heading. It is a cheery, optimistic message, contrasting conditions in 1914 with things as they are to-day. Private Peat, always a "headliner," is at his best in this article. But

Private Peat is only One of Many Features

In August MACLEAN'S there are half a dozen other writers with just as much "pull." Glance at this list:

"The Strange Adventure of the Man from Medicine Hat," a striking mystery story. By *Arthur Stringer*

"The Three Sapphires," a splendid serial story. By *W. A. Fraser*

"Keeping Borden in London," a fearless summary. By *Lt.-Col. John Bayne Maclean.*

"The Enemy Under the Earth," an article on the most terrifying phase of modern warfare—sapping warfare under the earth. By *Lt. C. W. Tilbrook.*

"Uplifting the Press," a satire on certain activities of the Dominion Government. By *One of the Uplifted.*

MACLEAN'S presents the vital and interesting things dealing with Canada—the most fearless criticism, the most entertaining comment, the biggest exclusive stories. Contributors to MACLEAN'S are the best writers and the most interesting personalities that the Dominion has produced. It is brimful of "features."

AUGUST MACLEAN'S

DAVIDSON-IZED

HIGH SPEED STEEL FORM TOOLS

By the DAVIDSON-IZED process two vitally important features are obtained in High Speed Tool Steel.

DAVIDSON-IZING in other words is intensifying and making the molecular structure more homogeneously continuous obtaining results from the various alloys heretofore believed impossible.

High Speed Steel thus treated has decidedly increased toughness with approximately 50% greater abrasive resistance. This alone constitutes 50% increase in the cutting efficiency of the tool.

DAVIDSON-IZED High Speed Form Tools are supplied in the rough annealed state ready to be machined to accurate size, ground and hardened. This represents a saving of over 50% of tool makers' time. Moreover, these tools are guaranteed against breakage in hardening.

Munition makers and manufacturers in Canada will save thousands of dollars by the use of DAVIDSON-IZED High Speed Steel Form Tools.

RESULTS:

Lower tool costs
Less tool expense
Less machining
Less grinding
Guaranteed against breakage in hardening process
Greater quantity production

Send drawings, blue prints or patterns and we will quote prices and speedy delivery.

"Mecol" Furnaces

Cost One Half

The First Cost

of coal-burning furnaces and their operating cost is so greatly less that such plants as Canadian Vickers, Limited, Montreal; Canadian Steel Foundries, Limited, Pointe St. Charles Works, and many other great plants use and recommend them.

BURN OIL

in Mecol Furnaces because they give instant and perfect control of temperature, save both time and fuel reaching the heat required, save labor, and for many more reasons that must appeal to your sense of economy and efficiency.

Write for all Particulars.

Mechanical Engineering Co., Limited

THREE RIVERS, QUEBEC, CANADA

The Right Furnace For Every Purpose

TYPE C-2

THE types shown are only two of over one hundred types and sizes of Gilbert & Barker Furnaces—a furnace for every purpose.

G. & B. Furnaces are built right. Their construction and design have been perfected by our half century of experience.

We offer you the benefit of this experience and thorough knowledge of modern heat-treating methods through our engineering department. The service is free. Put your problems up to us.

Just now we are making prompt delivery of these two types and many others. Send for Stock List 24.

TYPE C-15

Tate-Jones Furnaces at the Donner Steel Company's Works, Buffalo, N. Y.

An Overfired Annealing Furnace Fired With Raw Producer Gas

Successfully fired—which is more to the point. It is the only instance within our knowledge where raw producer gas is successfully used for firing a furnace of this type. Tate-Jones Heat Treating Furnaces meet with unqualified success whatever the fuel used.

TATE-JONES Overfired Annealing FURNACES

Save Fuel
Temperatures easily controlled
Large output of perfect work
Accurate temperature
Bigger and better output
Short time for preparation
Short time for heating process
Extreme durability

We will be glad to give, upon request, information about the points enumerated above. We have literature covering the subjects which should be in your files. Write for it.

Send for booklet—"Heat Treatment of Steel."

"ECLIPSE" SUD AND LUBRICATING PUMP

BRITISH MADE BY BRITISH LABOUR.

Made in 3 sizes:

⅜, ½, ¾.

20/-($4.86) 27/-($6.56) 34/-($8.26)

Cash; Ex-Works.

All with Relief Valves.

Unquestionably a high grade Pump at a low price.

Fitted with Gunmetal Wheels, Bush and Glands at the price of Steel Wheels and C.I. Glands.

Will prove superior to any Pump with Steel Wheels and C.I. Glands, &c.

AGENTS WANTED

Anybody Can Operate This Miller

and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

McDougall Shapers

These are up-to-date Shapers, designed for modern shop production.

They are plain in design, yet embody all essential features necessary for efficient work.

Every adjustment is convenient for the operator and fine for the most accurate work.

Let us have your inquiry.

The R. McDougall Company Limited

Manufacturers

GALT, ONTARIO, CANADA

The Canadian Fairbanks-Morse Company, Limited
Sales Agents

ARE-MAC-DEE IS A GUARANTEE

Stiff as Iron Can Make a Spur-Geared Planer Stiff

Rigidly stiff — and no chattering — even when crossrail is in its highest position. The top brace is massive. The bed is 23″ deep. The broad-box-form housings are 28″ deep, their faces in line to make the squaring up of work easy.

Other fine points that you'll appreciate! Write:

The Geo. F. Foss Machinery & Supply Company Ltd.

305 St. James St., Montreal, Que.

30 x 30 inches

TRADE C.M.C. MARK

26-in. Crank Shaper

DESIGNED to meet the requirements of modern conditions calling for extreme accuracy at the highest speeds and feeds. Machine throughout is very massive, to secure rigidity under the heaviest cuts. The most improved mechanical design, and the highest quality of workmanship, are employed in its construction.

SMALL TOOLS

Equip Your Tool Room With

PRATT & WHITNEY

Interchangeable Cutter Counterbores

and get the right combination at once.

HOLDER, CUTTER and GUIDE

With this combination you can immediately make the right combination for every counterboring job.

HOLDERS

End of holder is milled to receive the driving lug of the cutter, and there is also a hole and set screw to accommodate the shank of the guides.

GUIDES

Are of hardened tool steel. They are held in place by means of a set screw in the holder engaging a V-slot in the shank of the guide.

CUTTERS

Can be furnished of either carbon or high-speed steel.

The shank of the guide passes through the hole in the cutter and the shoulder between the guide and its shank keeps the cutter in place. Cutters can be sharpened on the face, and the guide is simply pushed further in the hole after grinding.

Holders, Cutters and Guides are furnished in a wide range of sizes.

PROMPT SERVICE

is assured at our nearest store where P. & W. Small Tools are carried in stock. Place your order there today.

TORONTO AUGUST 15, 1918

Selling the Buyer

BEFORE you make a sale it is only reasonable to assume that the buyer must be made familiar with the article or appliance you wish to sell. More than that, he will likely demand to know who you are, where you are, and all about you, or sufficient about you to enable him to determine what you have in the way of reputation to back the goods you have for sale.

THE process of making an actual buyer out of a prospect consists primarily in educating him. Education in all branches of endeavor is best accomplished by means of the *printed word*. It is not only the most *effective* medium, but it is the most *economic*. It not only accomplishes what it is intended to do, but it does it with the least possible expense.

IN every branch of commercial and industrial life we have to-day the *technical* or trade journals. Only the unthinking underestimate the power of those educative mediums. Their rapid growth and increasing circulation alone are convincing evidence of their usefulness. They are specialists in their respective fields of endeavor.

They are the great disseminators of practical information and trade news. Their clientele is made up of sober, thinking, ambitious, responsible mechanics and business men. The idly curious and irresponsible do not read them.

IT is because the technical journal is educational in character that so many manufacturers recognize in it the ideal medium for *educating* their army of probable buyers and customers to understand and appreciate the merits of their respective lines. It is because of this recognition and as a result of it that the advertisements of to-day are so vastly superior to the advertising of a few years ago, when, perhaps, the pulling power and value of the printed word was not so generally appreciated.

LITTLE WORDS WITH BIG MEANING

Quality

According to "Webster," Quality is "an excellence of character; natural superiority."

Service

Webster's definition of "Service" is; "The performance of labor for the benefit of another."

We use these words advisedly—fully understanding their definitions—and realizing the obligation we place upon ourselves by their continued use in connection with our products of Iron and Steel, and our attitude to the people we serve.

MONTREAL QUE.

Strong in the Neck

THE Howitzer, machine gun, rifle, aeroplane, tank, and every implement of war contains numerous drilled holes. Without these drilled holes their production would be well nigh impossible. With speed in production as the watchword, the importance of good drills for drilling these holes is apparent. The best drills are in big demand—thus the preference for

WILT

High Speed and Carbon Twist Drills

Wherever Wilt Drills are in use there you will find the highest production. Canada's largest manufacturers use them consistently. If you haven't adopted them give them a trial.

More 6" Shells

Do you want a substantial increase in your shell output with less labor and less cost? Adopt the Hepburn single bar boring lathe. Specially built to bore up to and including 6" shells. Speedy, powerful, accurate. Moderate in price.

We Rebuild Lathes

and equip them with all modern improvements. We do repairing of all kinds too. Let us hear from you.

John T. Hepburn, Limited

The New "Hamilton" Rapid Production Lathe

The central oiling system of the improved gear box and drop-forged apron gears, the sight-feed spindle oilers and the fact that every running part bears in bronze bushings, reduce friction to a minimum. Let us tell you why this cone head quick-change gear-type lathe is more powerful than any other lathe of its size—14 or 16 inch—and absolutely accurate. **Write:**

THE JOHNSON FRICTION CLUTCH

In the "Snyder" and a Host of Other Drill Presses

We feel justified in saying that Johnson Friction Clutches are in use wherever efficient drilling machines are manufactured.

Every day sees new names added to our long list of machines which have Johnson Friction Clutches in their design. This wouldn't be so if there wasn't something a little better than ordinary about Johnson Friction Clutches. A simple request for information about your own proposition will bring surprising details and prices.

16-inch double back geared Whitcomb-Blaisdell Lathe

The Material That Goes Into It—

That is the firm basis on which the **durability** of the Whitcomb-Blaisdell Lathe is founded. The head spindle is of 65 to 70 point carbon steel—the spindle bearings of a specially developed bronze—the beds of semi-steel castings—in fact, every detail is built of the best material obtainable. That construction, combined with the smooth, easy running secured by close accuracy, gives every Whitcomb-Blaisdell Lathe the ability to **stand up** under long, hard service.

Write for Catalog covering the entire line.

If You Need a
POWER HAMMER

of uncommon strength throughout — a hammer constructed to deliver work of surpassing quality in great quantity, and to keep everlastingly at it—

You Need Jardine's

Note a few particulars:

Hammer slide is a steel casting; so is the ram, and connecting bolts for the ram are machined from solid steel bar.

Hammer and anvil dies of properly tempered, highest grade tool steel are held in machine seats by tapered keys in the ram and anvil block, so there's no need to put taper on the dies.

Jardine's Canadian Giant Power Hammer has never failed.

Three Simple Parts
Mean Greatest Strength

In Simplicity lies strength. And in the popular Pexto Solid-Handle Wrench, with its three simple parts, you get super-strength at all points—with extra weight and strength where most needed.

The Pexto Solid-Handle Wrench heads the long line of Pexto Wrenches. By actual tests in various institutions it is the strongest wrench made. It is in general use to-day in railroad and machine shops, and is demanded by mechanics in every field. It is the all-around wrench for every-day or special work.

Has Unquestioned Lasting Power

The head, bar shoulder, and handle-frame are forged solid of one piece, then case-hardened to insure uniform strength and to overcome the weak point found in ordinary screw wrenches, namely, the likelihood of breaking at a point on the bar opposite the knurled thumb-screw.

The sliding jaw fits, with just enough play to work without binding. The screw is extra heavy, and the thread carefully machined.

The method of fastening the sliding jaw over the bar is covered by patents. This feature, instead of proving a weakness, as in other styles, adds even more to the strength of this good wrench—strength which cannot be gained in any other way.

There is a need for the Pexto Solid-Handle Wrench in the tool-kit of the mechanic in every field.

If your dealer cannot supply you, write us direct.

PEXTO
MECHANICS' HAND TOOLS

Roelofson Banding Machine

for 75 mm. and 155 mm. Shells.

Excellent Delivery

Our manufacturing facilities are such that we can make excellent delivery on machines for the above sizes. To shell plants changing over to the 75 mm. and 155 mm. shells this should be of especial interest.

Experimenting in Munition Making is Past

AND likewise experimenting in munition machinery is past. The "experiments" are all in the discard and only the machines properly designed and carefully built have survived.

Roelofson Band Turning Machines have stood up consistently under three years of the severest service possible. They have met every requirement of production and serviceability and are still doing duty in many Canadian munition plants.

Don't experiment with your 75 mm. and 155 mm. shells. Use the machine that has a record of three years of service behind it.

Note these features of construction:

Integral (en bloc) construction assures perfect rigidity, permanent accuracy and desirable compactness.

Chucking with spring collet chuck insures accurate and speedy chucking.

Graduated feed dial, two cutting tools, and ample belt power insure output of accurate work in least possible time.

Machines are also built for 15, 18, 60-pdr. and 6-in. shells.

PETRIE Heavy Duty Manufacturing Lathe—*20-Inch Swing*

A Heavy Simplified Lathe for Rapid Production Work

Designed and built especially for Machining High Explosive and Shrapnel Shells up to and including 8-inch. Used and Endorsed by many of the Largest and Most Successful Shell Manufacturers.

DESCRIPTION

HEADSTOCK All Headstock journals are provided with well lubricated, renewable bronze bearings. Alternate heat treated steel and bronze washers take the end thrust and a simple adjustment is provided to take up wear. All gears are covered with neat and substantial cast iron guards that may be quickly removed when desired.

BED The Bed is of deep construction and width to give the greatest rigidity under heavy cuts. The shears are made extremely massive and the bed walls extra thick, providing the necessary mass of metal to absorb the vibration and shocks incident to heavy turning at high speeds. Heavy box girths tie the front and rear walls of the bed together at close intervals. Improved type wide angle V on front shear to take thrust of cutting tool. The rear bearing of carriage on bed is flat instead of V-shaped. At the rear of the bed planed pads are provided for attaching Taper and Forming Attachments.

CARRIAGE The bridge is very wide and extraordinarily deep; it will not spring under the heaviest cuts. The carriage is gibbed to the bed at the rear on the outside and will not lift under any conditions.

APRON The apron is of heavy double plate type affording a support or bearing to both ends of all shafts. Apron is tongued and grooved to the carriage, also bolted and dowelled. The feed friction has a greatly increased diameter and will pull the heaviest feeds and cuts without slipping. For engaging the friction a hand wheel several inches in diameter is provided and seats the friction firmly with very small effort on the part of the operator. All studs in apron revolve and simple but adequate oiling facilities are provided.

FEEDS Positive Gear drive through headstock spindle, steel gears in gear box, three rates of feed are provided for through sliding key type. Feeds per revolution of spindle being ⅛ in., 1-16 in. and 1-32 in. All gears in the feed train are fully guarded.

TAILSTOCK The tailstock is a massive casting, rigidly braced internally, and is provided with a long nose, making it unnecessary to extend the tailstock spindle for ordinary work. It is clamped to the bed by four large locking bolts operated at the top of the barrel. A simple binder locks the tailstock spindle in correct alignment; this clamp is located at the extreme front end, where it grips the spindle with the utmost rigidity and absolutely does away with distortion of any kind. The screw is unusually large to resist any buckling tendency. Suitable screws are provided for setting over for Taper Work.

EQUIPMENT Unless otherwise specified Lathes are furnished with 8 ft. bed, one driving plate, hand cross feed, heavy duty plain rest, necessary wrenches, and two-speed tight and loose countershaft. Forming attachment, turret tool post, hand or power feed bed turret, oil pan, pump, and connections can be furnished as extras when desired.

DIMENSIONS

Swing over bed	20	in.
Swing over carriage	11	in.
Length of Bed Standard	8	ft.
Distance between centres 8 ft. bed	40	in.
Width of bed overall	19½	in.
Height from floor to centres	40	in.
Dimensions of front spindle bearing	4 15/16 in. x 6¾	in.
Dimensions of rear spindle bearing	4 in. x 5½	in.
Diameter Nose of spindle	4	in.

Hole through spindle	1 5/16	in.
Diameter Tailstock spindle	3⅜	in.
Travel of Tailstock spindle	6	in.
Morse Taper—Centers	No. 5	
Width of Tool Slide	12	in.
Diameter of Headstock Cones	11 in. and 14	in.
Belt Width	6	in.
Number of Feed Changes	3	
Feeds per Revolution of Spindle	⅛ in., 1/16 in., 1/32 in.	

Speed of Countershaft	110 R.P.M.
Size of Tight and Loose Pulleys	16 in. x 6¼ in
Ratio of Back Gearing	6.7 to 1
Face of Back Gears	2¾ in. and 2¼ in.
Length of Carriage Bearing	30 in.
Width of Carriage Bridge	12 in.
Number of Spindle Speeds with Two-Speed Countershaft	8
Weight—Approximately, 8 ft. Bed	5,300 lbs

Nova Scotia Steel & Coal Company

Limited

New Glasgow, Nova Scotia, Canada

THREE AND ONE-HALF AND FIVE-TON "FLUID COMPRESSED" STEEL INGOTS.

The Nova Scotia Steel & Coal Co., realizing the importance of "fluid compression" as a valuable aid in producing reliable and first-class steel products, procured by purchase the Canadian license from M. Harmet, of St. Etienne, France, whereby they own the sole rights in this Country to use his process. This they considered in accordance with their policy of taking advantage of every important metallurgical development, thus advancing with modern progress, and particularly that their high reputation as manufacturers of the best marine, railway and machine forgings obtainable should be maintained.

The "fluid compression" plant laid down at Sydney Mines, N.S., consists of one group of four Harmet presses, each of 1,250 tons and capacity to handle 3½ to 5-ton ingots; and one of 4,000 tons to handle ingots up to 30 tons.

The product of this process is used in the manufacture of high-grade forgings, such as locomotive axles, crank shafts, marine forgings, artillery tubes and armor plate of the highest grade; in fact for all commodities in which maximum reliability and homogeneity of structure enter and are demanded.

EVERETT, MASS., U.S.A.

The Usual Drive for Unusual Machines

UNUSUAL machines are designed to accomplish certain operations with unusual efficiency. Inefficient drives on such machines in a large measure defeat their purposes.

That is one reason why you will find many special, unusual machines driven with Link-Belt Silent Chain Drives. They deliver 98.2% of the power to the driving shaft of the machine. This has been repeatedly proven by actual tests.

Link-Belt Silent Chain Drives are "Flexible as a Belt, Positive as a Gear, More Efficient than Either." They increase production, save power, save space and effectively cushion shocks to machines requiring intermittent application of power.

Our booklet No. 341 shows many Machine Tool Applications and gives interesting driving facts. Write for it.

Chapman

Double Ball Bearings

CONSERVE POWER! There is too much power going to waste the world over. This fact has been noted by the British Government and sweeping reforms are contemplated in Great Britain.

Canada also wastes much power. A reform is necessary here, too. Babbitt bearings are being used too often where **Chapman Double Ball Bearings** should prevail. The adoption of Chapman Double Ball Bearings, wherever an axle or shafting needs support in the transmission of power, results in a saving of 75% of friction loss.

Now in use in over 2,000 Canadian factories. Fit any adjustable hanger. Adopted by Canadian and United States Governments.

Write for full story of their efficiency.

This is the Way the Gun Tap Cuts

90% of all taps break while being used.

What a saving could be made if this could be prevented!

THE "GUN" TAP SELDOM BREAKS

This is due to the shear cutting action which shoots the chips ahead of the tap. This prevents the chips from getting in the flutes between the lands and binding the tap till it breaks.

No backing out to clean out the chips. No breakage! The "Gun" tap goes clear to the bottom of the hole without breaking or without backing out to clean out the chips.

Send for booklet, which goes into detail.

HAND TRUCKS

Wherever an occasional use of a truck is required, a Fairbanks-Morse Hand Truck will prove satisfactory.

They are made in hundreds of styles for various needs.

Where trucking is a serious problem in any industry, we recommend the

"Automatic" Electric Storage Battery Trucks

These trucks will do the work of many men at much smaller cost. They are great labor-savers, and should not be overlooked if your trucking problem is a big one.

Jacklift Elevating Trucks

MADE IN CANADA

The majority of trucking problems are satisfactorily solved by the use of the elevating truck and platform system of handling goods.

The Jacklift Trucks are highly recommended for this work, and hundreds of manufacturers have shown their approval of them by their repeat orders.

New Works of Westinghouse at Philadelphia

The New South Philadelphia Plant of This Company Was Put Up in Record Time—A Little Over a Year Ago the Present Site Was a Plowed Field

SPURRED on by the need for ships, the Westinghouse Electric and Manufacturing Company has made a record in the erection and operation of its South Philadelphia works, now devoted entirely to the production of ship propulsion machinery for the navy and merchant fleet. A little over a year ago the present site was a plowed field; now it contains seven large buildings which give employment to 2,500 people. These buildings, comprising a floor space of over 600,000 square feet, include a pattern storage shop, foundry, forge shop, power house, erecting shop, and two machine shops.

The location is Essington, or South Philadelphia, about nine miles from Philadelphia on the banks of the Delaware River. Two steam railroads, an electric line and the river afford means of transportation, though the last mentioned has not as yet been utilized.

The greatly increased demands on the Westinghouse Electric and Manufacturing Company for steam-electric generating units, led to the necessity of seeking enlarged facilities, as those at East Pittsburgh were already crowded, and the South Philadelphia site, embracing 500 acres, was chosen as possessing more desirable qualifications than any other considered.

It is expected that eventually this plant will be of a size comparable with the East Pittsburgh works, which now employ in the neighborhood of 25,000 people, and cover a floor space of over 100 acres.

A portion of the land will be devoted to a town site capable of accommodating about 5,000 people, though as yet no housing has been erected in deference to the desire of the government that all building activities be restricted to those closely related to the production of materials needed in the prosecution of the war.

An interesting feature is the use of standard gauge trucks through the yards and buildings so that all transportation whether railway or interworks, is carried on the same tracks, and maintenance of tracks and equipment of different gauges is avoided.

Electric energy for operation of the works is obtained in the summer months from the Philadelphia Electric Company at 66,000 volts, and through the steam turbines in the company's plant in the winter months, when the exhaust steam is used to heat the buildings. Distribution of current is made throughout the

EXTERIOR VIEW OF FOUNDRY.

WESTINGHOUSE ERECTING SHOP.

grounds at 6,600 volts by means of lead covered cables laid underground to substations located in the various buildings. Here it is changed to the current of the proper kind or character for the work to be performed.

Compressed air for manufacturing purposes is obtained from synchronous motor-driven air compressors located in the substations.

Water for all purposes except drinking and cooking is obtained from the Delaware River through an open canal, which terminates in a reinforced concrete box on the testing floor in the erecting shop, where an adequate supply of water is required for testing purposes.

A similar and parallel canal acts as an outlet and storm sewer, the entire installation having been designed to take care of anticipated plant development.

An unusually elaborate sewage disposal plant, embodying the Imhoff system with lime as a precipitant, has been installed.

The selection of the site and the general direction of all the activities incident to the erection and operation of the plant have been in charge of Mr. H. T. Herr, vice-president, who has had as his assistant, Mr. R. B. Mildon, who has had general supervision of the construction of the plant.

The plant has been erected by Westinghouse, Church, Kerr & Company, with which firm, Mr. Calvert Townley, assistant to president, has handled all business relations, subject to the approval of the president, Mr. E. M. Herr.

INTERIOR VIEW OF MACHINE SHOP.

WORKING WITH OR AGAINST THE OTHER SHIFT

By J. H. Rodgers.

Factory harmony may frequently prove to be a very important factor in determining the resultant efficiency of any industrial plant. This not only applies to the smoothness and regularity in which the work progresses through the sequence of the many detail operations, but to the conscientious co-ordination of the different parties involved in the achievement of the results desired. Apart from what has been attained by the adoption of automatic, semi-automatic, and special purpose machines for increasing and maintaining production at maximum figures, the human element still remains the foundation upon which the structure stands or falls. From the head executive to the small errand boy, every intermediate employee is responsible for the performance of certain duties upon which depends the success or failure of the enterprise. Weakness in any structure must inevitably mean its partial or total collapse. To repair this defective for serious results are effected is not only a necessity, but it is equally essential that the cause of the trouble should be located, and steps taken if possible to prevent an occurrence of the trouble.

In many manufacturing establishments, production is often affected by the petty dislikes or grievances of some of the workmen or foremen, or the lack of co-operation between different departments, in which interharmony and mutual understanding is of vital importance, when considering plant efficiency as a whole. It may often happen that individual inefficiency can be traced to a certain workman—at least as far as outward appearances prove—but upon

INTERIOR OF SUBSTATION, WESTINGHOUSE PLANT.

closer investigation it may be learned that others are indirectly involved for the unsatisfactory achievement.

The Way to Success

Nowhere is close co-operation more urgently required than in those factories where progressive operations are carried on in the manufacture of this product. This applies particularly to the shell making industry as an outstanding example of production on a highly standardized basis. In the majority of munition plants the character of the work and the quantity produced requires the installation of equipment that will virtually meet the predetermined requirements. These expectations are invariably based on the supposition that the workmen employed will continue to operate their machines with comparative regularity to avoid unnecessary disorganization in the routing of the work.

Needless Squabbling

Mutual misunderstanding or petty differences may lead to conditions that cannot but reflect on the progress of the work, and consequently the ultimate output. The writer, on several occasions, has listened to—and been inwardly amused at—somewhat heated harangues between two employees on adjacent machines as to the careless manner of the former in getting rid of the shells after his own work had been accomplished. Some men are so selfishly inclined that little or no consideration is given to anyone or anything, unless they can directly benefit. In one of the instances just referred to it appeared a particular delight for the first man to place his mate—on the succeeding operation—to the extreme inconvenience in picking up the shell for his particular operation.

A Friendly Spirit

A feature that seems to have received little attention is the possibilities that might be derived by developing a more friendly spirit among the men, particularly between those men that are called upon to operate the same machine on the different shifts. In many instances these two men never see each other, and where two workmen with widely different characteristics are operating the same machine—one by day and the other at night—it is quite reasonable to expect that perfect harmony cannot exist between the two unless some kind of mutual understanding exists between them, and which can only be acquired by personal contact. I have spoken to men who have told me that it was sometimes an hour before they got going owing to the inability to locate the tools and put the same in condition to his own particular taste. Asking one of these as to the care he exercised in leaving the machine and tools in good condition for the night hand, he replied, "Why should I worry, I have to look out for myself when I come in in the morning, why shouldn't he?"

To illustrate what might be done in this direction, I might cite an instance where the peak of efficiency was attained in machine tool operation. It was in connection with shell making, and strange to say was brought to my notice by one of those who made a remark similar to that quoted above. To quote the "dissatisfied" workman—"I wish I had a night mate like this chap next me, he succeeds in getting out from 5 to 10 per cent more work than I do and appears to do so with a lot less trouble." Upon inquiring from the lad referred to I learned that the man on the night shift was his own brother and that they had made a close study of the machine and operation, with the object of making the most of their opportunity. "We always endeavor," he told me, "to have a few minutes together on the change of the shift to explain anything that will possibly assist the other in his work during his period. By doing this we can learn the condition of the shells then passing through, whether it is a series of hard or mild steel, so as to guide us in the grinding of our tools and the general operation of the machine. Not only in the actual operations do we have a mutual understanding, but in the location of all accessories such as oil cans, wrenches, gauges and all other tools, we have made a practice of having these always in their own place so that no hunting is required when one or the other of us require them. By this method we have been able to devote all the time to the actual work in hand and I believe that our record is not equalled by any other two men in the shop."

It was not that either of these young fellows were better workmen than others in the shop, but that they had started out with the idea that a minute saved was a minute earned, and in the piecework principles of production the minutes saved invariably meant money earned. The results of these two men were not only satisfactory, but highly profitable.

OUTDOOR SUBSTATION AT NEW WESTINGHOUSE PLANT.

Man vs. Nature in Manufacture of Diamonds

Experiments Have Been Conducted Trying to Devise Process That Would Successfully Produce Precious Stones—Attempts Have Been Made to Melt Carbon, but With Indifferent Success

By SIR CHARLES PARSONS, F.R.S.

MANY theories have advanced to account for the origin of diamonds, but I propose on this occasion to confine myself to what has been done in the way of systematic researches and investigations on this subject, and to consinder whether it is possible to arrive at reliable and definite conclusions based on adequate foundations.

Henry Moissan must be credited with having been the first experimenter to make, and to identify with certainty, genuine artificial diamonds. In the "Fours Electrique," published in 1897, his researches and experiments are very fully described in minute detail. He generously alludes to the previous experiments of Marsden, published in the Proc. R.S., 1880-1881, and says he was the first to observe that if silver is melted in a carbon crucible and raised to the melting point of steel, on cooling, black diamond is sometimes found in the centre of the ingot. He moreover, states that he has repeated the experiments of Marsden and found that when a small mass of silver is quickly cooled, a satisfactory yield of black diamond results, but that transparent diamonds are never produced in silver. Moissan further adds: "The work of Marsden is of the highest interest, because he observed quite correctly the great number of different crystallized products which may be formed at the solidifying point of silver when it gives up its oxygen, alumina, silica, silcide of carbon, &c." Moissan in 1892 developed the electric furnace and applied it to his classical experiments, which resulted in the production of minute transparent diamonds in small ingots of iron, and also black diamonds in ingots of silver, when highly heated and quickly cooled in water or in chills. Moissan attributes the formation of the diamond in silver and also in iron to the compressive forces produced by the contraction of the outer layers and dilation of the molten nucleus when setting.

What occurs in a mass of iron so treated, I propose to discuss at some length, and to lay before you evidence that the gases occluded in the metal are the real cause of the production of diamond, and not the bulk pressure as has been previously supposed. We shall see that the weight of diamond found in an ingot of iron has in one case reached 1 ÷ 20,000 part of the weight of the ingot, or about 1 ÷ 1000 part of the carbon present—and that its quantity is of about the same order as the amount of carbon present as carbon monoxide occluded in the ingot. Moissan expressed the opinion that iron in a pasty condition was the matrix of the diamond, and that great pressure was the determining factor, which compelled a minute fraction of the carbon present to appear as diamond, and in his experiments he further speaks of the probability of carbon being liquefied when under a pressure sufficient to prevent its volatilization, and that from the liquid state it may pass into the crystalline or rounded form on cooling. Crookes, in his lecture delivered before the British Association at Kimberley, in 1905, emphasized the same view as to the probability of the crystallization or carbon directly from the molten state on cooling. Crookes in the same lecture also stated: "It is certain from observations I have made, corroborated by experience gained in the laboratory, that iron at a high temperature and under great pressure conditions existent at great depths below the surface of the earth—acts as the long-sought solvent for carbon, and will allow it to crystallize out in the form of diamond."

There is no prima facie reason against this view. The calories evolved in the combination of graphite and oxygen are about ½ of one per cent. less than those evolved in the combination of diamond and oxygen, indicating that graphite at ordinary temperature is, to this extent, the stable state. The bulk pressure which has operated in some of our experiments would, however, seem to have been amply sufficient to turn the balance in favor of diamond instead of graphite. The uncertainty, on the other hand, as to the compressibilities and specific heats of the allotropic forms under high pressures and at high temperatures renders speculation of little value as to what may occur at the melting point of carbon. All we know is, that up to the pressures and temperatures reached in our experiments no indication of a change from graphite to diamond has been produced.

I will now briefly describe some of our experiments which seem to bear most directly on the subject. Before doing so it is desirable first to describe the apparatus employed.

The first experiments were made in 1886 to 1888 under an 80-ton press and with current supplied from a turbo-generator of 35 horse-power; the results were given in a paper to the Royal Society in 1888. The experiments were resumed in 1907 with a new equipment which consists of a 2000-ton hydraulic

FIG. 1

FIG. 2

FIG. 3

press and a storage battery of 360 kilowatts normal output. The battery can be coupled for 2, 4, 8, 16, 48 volts as required, and the mains and main switch can carry currents up to 80,000 ampères to the hydraulic press, which is placed by itself in a small strong

FIG. 4.

house, partly below ground, with walls of 2ft. thickness reinforced with steel bars—the door is of steel 3in. thick—the roof is of light galvanized iron. The moulds under the press are further enclosed by 2in. thick telescoping steel rings raised into position by steel ropes and counterweights. These precautions, as experience proved, were necessary, as several violent explosions occurred which cracked the steel rings and blew off the roof. A charge of iron and carbon when confined and raised to a high temperature may be very violent if suddenly released by the melting of the pole pieces. A steel mould of 9in. diameter was first used, but smaller moulds of 4in. and 2in. diameter have given satisfactory experiments and are more easily and quickly repaired and admit of higher pressures under the press. We will first consider the experiments on carbon and compounds of carbon when heated under pressure by means of a central conducting core through which an electric current is passed.

The result of treating benzine, paraffin, treacle, chloride and bisulphide of carbon, &c., under pressures up to 4400 atmospheres resulted in the production of a soft coating of amorphous carbon on the heating rod, and when the current was very intense the carbon rod and the contiguous layer were transformed into graphite. In one experiment several pounds of carbon dioxide snow were added to the charge, which consisted of magnesia, and was so arranged that evaporation of the heating carbon rod took place in an atmosphere of carbon dioxide and carbon monoxide, under a gaseous pressure of 4400 atmospheres, the condensate resulting being soft graphite. Upwards of 200 chemical reactions arranged to deposit carbon were tested under high pressure and central heating. After each experiment samples were taken from various parts of the charge and carefully analysed for diamond, the methods of the analyses generally following those of Moissan and Crookes. Small residues of diamond occasionally occurred, but the appeared to be associated with the presence of iron in the charge, whether introduced intentionally or from the melting of the pole pieces, short circuits, or from other causes. On the whole, there was no evidence that diamond had been produced by any of the chemical reactions, some of which were violent and caused explosions, and expanded the container. Some were endothermic, such as carborundum and sodium carbonate, which produced a grey solid which detonated.

We now pass on to consider the experiments designed to melt carbon in bulk, and I deal with them in some detail because so much prominence has hitherto been given to this aspect of the question. The barriers used were composed of quick-lime, marble, titanium oxide, or magnesia calcined in the electric furnace; of these magnesia gave the best results, being the more slowly converted into carbide. Intense heat was applied in one experiment for 5 sec., but sufficient in amount to melt the graphite core six times over, the only result being a slight alteration of the structure of the graphite. Threfall independently came to the conclusion from his experiments at about the same time (1907), that under 100 tons, or 15,000 atmospheres pressures per square inch, graphite, electrically heated, remained graphite. It appeared, however, desirable further to investigate the possibility of carbon losing its electrical conductivity when approaching its melting point, as alleged by Ludwig and others, and of shunting the current from itself on to the contiguous molten layers of the insulating barrier surrounding it. There had, however, been no indication of such a change having occurred, even momentarily; it rather seemed that the graphite core had been partially vaporised and condensed in the cooler parts of the charge. The experiment was, however, repeated with rods of iron and tungsten imbedded in the core, so that should the temperature of volatilisation of the metals under a pressure of 12,000 atmospheres exceed that necessary to liquefy carbon under the same pressure, the presence of these metals might produce a different result| No change, however, occurred, though in one experiment the pressure was raised to 15,000 atmospheres. A different method of attack was then arranged which would ensure that carbon should be subjected to an extremely high temperature concurrently with high pressure, obtained by the rapid compression of the hottest possible flame, that of acetylene and oxygen, with a slight excess of the former to provide the carbon. The arrangement was as follows:—A very light piston made of tool steel was carefully fitted to the barrel of a duck gun of 0.9in. bore; the piston was flat in front, lightened out behind and fitted with a cupped copper gas check ring, the cup facing forward; the total travel of the piston was 36in. To the muzzle of the gun was fitted a prolongation of the barrel formed out of a massive steel block, the joint being gas-tight. The end of the bore in the block was closed by a screwed-in plug made of tempered tool steel, also with a gas-tight collar. A small copper pin projected from the centre of the plug to give a record of the limit of travel of the piston. The gun was loaded with 2 drachms of black sporting powder, which amount had been calculated from preliminary trials. The barrel in front of the piston was filled with the mixture of acetylene and oxygen. It was estimated that this mixture would explode when the piston had travelled about half-way along the bore; when fired the piston travelled to within ⅛in. of the end, as had been estimated, giving a total compression ratio of 2888 to 1. As a result it was found that the surfaces of the end plug, the fore end of the piston, and the circumference of the bore up to ⅜in. from the end of the plug had been fused to a depth of about .01in., and were glass hard, the surface of the copper pin had been vaporised, and copper sprayed over the face of the end plug and piston. The end plug, which had been hardened and tempered to straw colour, showed signs of compression, and the bore of the block for ⅜in. from the plug was enlarged by .023in. in diameter, both indicating that a pressure above 15,000 atmospheres had been reached.

A little brown amorphous carbon was found in the chamber, which was easily

FIG. 5.

destroyed by boiling sulphuric acid and nitre, there was no diamond residue from this. There was, however, a small crystalline residue from the melted layer of the end plug, from which was isolated one non-polarising crystal, probably diamond, but too small to identify with certainty. Considering the light weight of the piston and the short duration of the exposure of heat, the small diameter and volume of the end clearance space, the effects would seem to indicate that a very abnormal temperature had been reached, many times greater than exists in the chambers of large guns. There was, however, no evidence of any melting and re-crystallisation of the carbon present. A calculation made by Mr. Stanley Cook, based upon the ratio of

compression and a final pressure of 15,-0000 atmospheres, indicates that a temperature of between 15,250 deg. Cent. and 17,700 deg. Cent. was reached, the exact temperature depending upon the amount of dissociation or combination existing between the elements at the time.

It seemed desirable to try the effect of still higher pressures, so a rifle, .303 bore, was fitted with a specially strong breech mechanism by Rigby, capable of withstanding a charge of cordite 90 per cent. in excess of the service charge.

The gun was fixed with its muzzle 6in. from a massive block of steel, in which a hole, 303 diameter, had been drilled to a depth somewhat greater than the length of the bullet, and in alignment with the bore of the gun; cylindrical bullets of steel, with a copper driving band, were chiefly used, shorter than the service bullet, and about one-half of the weight, some with cupped noses to entrain material, some with coned noses to match the bottom of the hole in the block. The velocity with 90 per cent. excess charge was estimated to be about 5000 ft.-seconds. The substance to be compressed was placed either at the bottom of the hole when a conical-nosed bullet of mild steel was used, or over the mouth of the hole when a cupped-nose of tool steel was employed. About 100 experiments were made. The substances tested included graphite, sugar carbon, bisulphide of carbon, oils, &c., graphite and fulminate of mercury, finely divided iron and fine carborundum, olivine and graphite, &c. After each shot the bullet and surrounding steel were drilled out, and the chips and entrained matter analysed.

Several experiments were also made with a bridge of arc light carbon placed over the hole and raised to the limit of incandescence by an electric current, and the shot fired through it into the hole at the moment the carbon commenced to vaporise, as observed in a mirror from without. Also an arc bebtween two carbons was arranged just over the hole, and the shot fired through it.

Of all the experiments only two yielded a reasonable amount of diamond residue, one made with graphite wrapped in tissue paper, the bullet, however, in this case having grazed the side of the hole, and thus producing some molten iron by the friction; the other with the incandescent bridge, where again some molten metal would probably occur. The residues were in all cases exceedingly small, and not more than would be produced from a very small amount of iron melted, carburised, and quickly cooled.

There was no evidence of any incipient transformation of carbon in bulk into diamond that could be detected by analysis.

The pressure on impact of steel bullet fired into a hole in a steel block which it fits is limited by the coefficient of compressibility of steel, and with a velocity of 5000 ft.-seconds is about 2000 tons per square inch. Measurements made from a section through the block and bullet showed that the mean retardation on the frontal face after the impact till it had come to rest was abobut 600 tons per square inch.

FIG. 6

FIG. 7

Several experiments were made by substituting a tungsten steel block, and a hole tapering gently from .303in. at the mouth to .125in. at the bottom. The mild steel bullet was deformed by the tapered hole, and a greatly increased velocity imparted to the nose. Progressively increased charges were used ,and even with relatively small chargs the block cracked on the second round. With the 90 per cent. excess charge, the block always split on the first shot, but this probably occurred after impact, and not till the full instantaneous pressure had been exerted, which was estimated to be greater than with the plain hole, probablby exceeding 5000 tons, a pressure about equal to that at the centre of the earth.

In these latter experiments graphite was placed at the bottom of the hole. The analysis yielded nothing but graphite.

Experiments on Pressure in Cast Iron When Cooled.

It has been generally assumed that iron rich in carbon expands on setting, and that this supposed property is a contributory cause in the formation of diamond by increasing the pressure in the ingot.

We made several experiments by pouring iron, saturated with carbon, from the electric furnace through a narrow git into a very massive steel mould, closed at the bottom with a breesch screw—Fig. 9. When cold the breech screw was easily removed, and there was no sign of there having been any appreciable pressure on the threads. Not being sure that, because of capillarity, the corners of the mould had been quite filled, a steel mandril was, immediately after pouring, forced down the git hole by a press giving a fluid pressure in the mould of 75 atmospheres. The observed pressure on the breech screw appeared not to have exceeded this pressure. Highly carburised iron, therefore, does not expand with any considerable force on setting.

The reason why a lump of cast iron thrown into a ladle of molten metal first sinks to the bottom and soon rises and floats on the surface is probably that cast iron is about seven times stronger in compression than in tension. Therefore, when a sufficiently thick layer of cold metal has been heated, the interior is torn asunder by the expansion of the outer skin, and the specific gravity of the whole mass is diminished.

We may, therefore, safely conclude that when iron is suddenly cooled, the only compressive bulk pressure that is brought to bear on the interior is that arising from the contraction of the outer layers after setting, and with highly carburised iron this can only be moderate because of the low tensile strength of the metal, and cannot exceed about 1000 atmospheres.

Moissan observed that spherules or globules of iron with cracks never contained diamond. To such he attributed a loss of mechanical pressure; we now think that they merely provide an outlet for the occluded gases from the metal. We have made experiments by pouring highly carburised iron and alloys of iron on to iron plates, the cooling taking place from one side only, and under such conditions no diamond results; in fact ,it only occurs when the ingot or spherule is cooled on all sides simultaneously so that a gas-tight skin is formed all over before the centre is cooled.

Since my paper to the Royal Society, in 1907, the experiment of heating iron in a carbon crucible, and transferring it to a steel die, and subjecting it to 11,-200 atmospheres, has been repeated, this pressure being many times greater than can occur in a cooled ingot, and it has been found that if the iron is allowed to set bebfore the pressure is applied, the amount of diamond is much greater than if pressed when very hot, and while still molten, and that under the former condition it is about the same as when the crucible is cooled in water. The only reason that suggests itself to account for this is, that when pressure is applied, dwhile very hot, some of the iron permeates the carbon of the crucible, and

because of the greater specific heat and lesser conductibility of the carbon, the iron next to and in the carbon remains molten after the ingot has been cooled from the top by direct contact with the steel cup on the face of the plunger; thus when cooling, the occluded gases have a free exit from the ingot through the molten metal (which is pervious to gas) into the carbon of the crucible, and are not retained in the ingot to the same extent as when it has set before pressing, and is enclosed on all sides in an envelope of iron impermeable to the gases.

These experiments, I think, it will be agreed, dispose of the bulk-pressure theory of the production of diamond in cooled iron. In fact, none of our experiments have shown that bulk-pressure has any effect whatever on the production of diamond unless in so far as it may affect the amount and distribution of the occluded gases within the ingot. Several experiments were made to try

FIG. 8.

the effect of extremely quick cooling, by transferring a crucible with a charge of iron from the electric furnace to the press and submerging it in carbon dioxide snow, and also in water, at 6000 atmospheres—the analysis showed very little diamond. Other experiments where extremely quick cooling was effected not under pressure confirmed the view that quick cooling as such is not a factor in the production of diamond ,and that carbon is not caught in a state of transition by quick cooling.

Experiments were made on oxidising alloys of iron by superheated steam after heating in the electric furnace; large residues of crystalline oxides of the metals of the alloys resulted as had been observed by Marsden in silver, and there also was a small percentage of the residue (about 5 per cent.) of very minute crystals which burnt in oxygen, and had a specific gravity of 3.5, and are, therefore, diamond.

This part of the subject appears to merit further investigation.

Experiments Under Vacuum.

The presence of diamond in some meteorites suggested a series of experiments under various degrees of vacuum up to the highest obtainable.

It seems probable that in past ages some meteoric matter may have been melted by collision or ejected into space in a molten space and cooled by radiation, and that under such conditions absence, or diminution, of occluded gases might be a factor conducive to crystallisation of diamond.

More than fifty experiments were made with electrical heating of a carbon crucible under vacuum. Fig. 11 shows the first container used, which was evacuated to about 1-6 mm. of mercury by three steam jets in series with an air pump and jet condenser.

This apparatus was subsequently replaced by a molecular air pump of very large capacity working in series with two other pumps, which could maintain an X-Ray vacuum during the whole of an experiment. Fig. 12 shows the container. The suction outlet to the pump is 18in. in diameter.

When in this apparatus iron and alloys of iron were heated under high vacuum, the large volume of gas given off by the metal was very striking, and unless the heating was very gardual much of the metal was ejected from the crucible. It became quite apparent from the experiments that metal ejects the occluded gases slowly and absorbs them slowly. It was remarkable that in no experiment under a vacuum higher than 2 mm. was diamond ever found in the ingot crucible, but it was found in the ejected iron which had not fully parted with its occluded gases. Here again we have impressed on us by these experiments that occluded gases are essential to the production of diamond in cooled iron. Experiments were made under low vacuum—Fig. 10—averaging about 1in. of mercury, the gas in the container being 95 per cent. carbon monoxide. The heating up was prolonged and the cooling was effected solely by radiation and convection, and was relatively slow, occupying 15 sec. from switching off the current to the setting of the metal. Some of the diamonds produced in this way, the largest measured 0.7 mm. in length.

Let us for a moment recur to the experiments designed to impose the greatest possible bulk pressure on carbon and also on iron. The experiments designed to melt carbon have been carried up to 15,000 atmospheres steady pressure, and to 300,000 atmospheres momentary pressure, which pressures are nearly up to the maximum possible with the materials at our disposal. 300,000 atmospheres, or 2000 tons per square inch, is about one half the probable pressure at the centre of the earth—but only a fraction of one thousandth's part of the pressure at the centre of large stars or also of the pressure produced by the impact of large bodies in space. By such collisions and intense heating and cooling, short or prolonged, of large masses might occur by the adiabatic compression of the central portions of the colliding bodies. Under such conditions the Moissan effect might be produced on a large scale, and if heating and cooling of iron are the only essential conditions, would result in the production of large diamonds. One source of diamond may, therefore, be attributed to prehistoric falls of meteorites. The artificial reproduction of such conditions is obviously beyond our reach. Up to the present, as we have said, the only proved source of artificial diamonds is from iron or silver intensely heated, and then cooled with more or less rapidity. I now pass on to further consideration of this question.

We have seen that the evidence is very strong, or perhaps conclusive, that the occluded gases which escape on the setting of the metal and during cooling are a vital factor, and that unless such gases are retained within the ingot no diamond results. We have further seen that great pressure on the metal when molten and cooling makes no difference in the yield, also that the retention of the occluded gases is in this case likewise essential. The experiments under vacuum have shown that if the metal

FIG. 9.

has had time to lose its occluded gases no diamond occurs, so that we may conclude that under all bulk pressures on the metal occluded gases are an essential factor.

Let us consider what happens inside an ingot or spherule when rapidly cooled simultaneously on all sides. It is first surrounded by a thin coating of solidified metal, which below 600 deg. Cent. is nearly impervious to gases. As the coat thickens, layer within layer, more and more gas is ejected by the solidifying metal, and is forced inwards, the diminishing nucleus of molten metal and its semi-solidified centre layer still pervious to gas receives the charge, and as this process progresses the pressure may rise higher and higher, though there may be a limit to the pressure against which the metal is able to eject gas when setting. All we, however, know is that the mechanical strength of the ingot or spherule places a limit of about 1000 atmospheres to the gaseous pressure when concentrated into a small nucleus. In the case of some iron alloys which occlude more gas than iron, most of the spherules are split or shredded with an appearance consistent with this view.

It would seem that the chief and only function of quick cooling in the produc-

tion of diamond in an ingot or spherule is to bottle up, and to concentrate into local spots within it, under high pressure, the gases occluded in the metal which, during slow cooling, would partially escape, while the remainder would become evenly distributed throughout the metal.

Crookes' microscopical examination of diamonds with polarised light supports this view. I now quote a passage from his lecture at Kimberley in 1905. He says: "I have examined many hundred diamond crystals under polarised light, and, with few exceptions, all show the presence of internal tension. On rotating the polariser, the black cross most frequently seen revolves round a particular point in the inside of the crystal; on examining this point with a high power, we sometimes see a slight flaw, more rarely a minute cavity. The cavity is filled with gas at enormous pressure, and the strain is set up in the stone by the effort of the gas to escape."

Diamonds appear to be formed in the metal after it has set. Moissan found that the diamond occurred near the centre of the ingot, and he remarks that natural diamonds must have been formed in a pasty matrix, because they never show evidence of attachment to a hard body. But the most conclusive proof seems to be that we have found that a diamond is rapidly corroded by highly carburised iron just before setting, so that a microscopic diamond could not exist in molten metal for a second.

On the whole I think that diamond is probably formed at a temperature of about 690 deg. Cent., one of the points of recalescence, while the metal is still somewhat pervious to gases.

A heat treatment at high temperatures in the electric furnace appears to be essential ,and it is probably required to form carbides, within the mass, other than those of iron, and which react with the occluded gases after solidification. The view that carbon monoxide is the most important of the occluded gases is supported by the increased yield of diamond from iron which has absorbebd much of this gas before cooling, and also by the fact of its combination with the metals, and also with silica and sulphur as carbonyls. Its remarkable action in association with iron on carborundum appears further to emphasise this view. In this connection Carpenter observed some years ago that the gases given off from cast iron at red heat under high vacua contained silica. We have seen that in rapidly cooled iron the occluded gases must be much compressed at the time the diamond is formed, and Mond has shown that pressure, in the case of iron, increases the yield of ferro carbonyl ,and also is essential to the formation of the carbonyls of some other metals.

There is strong evidence to support the view that the action may take place solely between iron carbobrundum, sulphur, and carbon monoxide. It is, however, probable that other metals may also be involved, and that the action is one of great complexity. It must always be remembered that the yield of diamond is extremely small, and therefore very small traces of some of the elements may suffice to satisfy the action. Very little is, however, known and patient experimental research has here a most attractive field. As I have said, the largest percentage of diamond we found in cooled iron was estimated to be 1 ÷ 20,000 the weight of the iron, and 1 ÷ 1000 part of the carbon present, and if we assume that the iron contained a volume of carbon monoxide equal to .69 of the volume of the ingot—a common proportion — the weight of carbon in the carbon monoxide exactly equals the weight of diamond. The yield of diamond from the South African Blue Ground of the De Beers Mine in 1904 was 1 ÷ 5,400,000 of the weight, so that the yield from cooled iron in the best experiment has been 270 times greater.

I am not disposed to speculate, but may venture to suggest that it would seem probable that if a large mass of iron ,alloyed with other elements, was submitted to suitable heat treatment, and after setting, but when still at a temperature permeable to gas, was subjected to carbon monoxide at a pressure of about 1000 atmospheres for a long time that segregations might take place slowly within the mass, and diamonds in payable quantity and size might be produced. This experiment virtually consists in replacing the cold metal envelope thrown around the ingot by a gaseous envelope at a superior pressure, which will not only imprison the occluded gases, but further, by the ingress of additional gas into the metal, may induce the formation of diamond throughout the whole of the ingot. It may be found that higher gaseous pressures than those permissible in a cooled ingot may increase the yield, and if is found to be the case they can be easily applied.

In rapidly cooled iron there is a steep temperature radient in the metal, but when under gases at high pressure it seems probable that the natural tendency to segregation on slow cooling may suffice to determine the local concentrations which form diamond.

The presence of crystals of silica, alumina and magnesia ,and the spinels and pyrope, &c., associated with diamond in rapidly cooled iron alloys, and also when oxidised by steam, appears to have a bearing upon the presence of similar crystals generally found in association with diamond and merits further investigation. The solution which I have indicated appears to be compatible with the conclusions of Bonney that eclogite is the parent-rock of the diamond in South Africa. He says: "Thus the diamond has been traced up to an igneous rock. The blue ground is not the birthplace either of it or of the garnets, pyroxenes, olivine, and other minerals, more or less fragmental, which it incorporates. The diamond is a constituent of the eclogite, just as much as a zircon may be a constituent of granite or a syenite. Its regular form suggests that it was the first mineral to crystallise in the magma." The solution we have suggested also accounts for so small an amount of carbon having escaped oxidation, for according to our view both the diamond and the eclogite have ben crystallised in iron at comparatively low temperatures.

It is possible that there may be other feasible solutions to the problem. For instance, it is possible that at a suitable temperature carbonic oxide under high pressure might cause diamond to crystallise in olivine, blueground, or eclogite, if some of the constituent elements were present, as metals and carbides, with some it would form carbonyls, and with others it would react.

A Modern Machine Shop and Its Management

The Proper Layout of the Plant Has Much to do With the Success or Failure of the Operations Carried on There—Essentials That Should be Kept in Mind in Constructing Shop and Tracks

No. 1 in Series of Articles by M. H. Potter.

GENERAL PLANS AND ARRANGEMENTS

As a rule the amount of land is limited and therefore a compact form is necessary. The compact form, capable of easy expansion in any direction, is chosen as likely to be the most useful one to those desiring information on this subject. The handling of materials and the transportation of them is made as simple, direct and economical as possible.

A railroad track should pass near the works, and from it a branch should be brought past the rear and to one side of the collection of buildings. Such an arrangement results in a great saving in the expense of hauling both material and product, and permits the general arrangement and development of the plant as here described.

Main Building

The main building or machine shop is divided lengthwise into a central portion, with side bays. The central portion is open clear to the roof and has a traveling crane of ample capacity moving over its entire length. The side bays are divided into a main floor, on a level with the central portion, and a gallery or second floor. This gallery is extended across the front end, thus connecting the two galleries and furnishing a platform by way of which the traveling crane may transfer material and product to and from the main floor. Along the center of these galleries and across the front runs a tram track, provided with light push cars for facilitating the transfers. Stairways are provided at each end in the center for conveniently and speedily reaching any part of the shop from floor to galleries.

At the front end of the machine shop proper are the offices connected with and forming a part of it, consisting of two structures with a driveway space between them. On the first floor of these are the offices, storerooms, etc., and in the other the tool-making room, a room for storage tools and fixtures, and a stock room, for the small finished parts. On the second floor is located the drawing room, while over the driveway is the pattern shop.

The offices are only those particularly connected with the manufacturing and shipping, and not the general offices of the company. A wing connects the front buildings with the foundry. The ground floor of this wing is used as a storage room for pig and scrap iron, and a flask room, while the second floor is a pattern storage loft, connected at one end with the pattern shop and at the opposite end with the foundry by a trap door directly over the train track leading through the flask room.

Foundry

The foundry is arranged with a central part and two side bays. The central part is covered by a traveling crane running the entire length. There are two cupolas, a large and a small one, served by two cranes of sufficient reach to swing into the central space covered by the traveling crane.

Large work is cast in the central space or within reach of the cranes, while small work and bench moulding occupy parts of the floor not covered by the cranes. On each side of the central part are tram tracks, which are crossed by one running to the flask room and one that goes through the chipping room and on across the yard to the machine shop.

A bay built on the side of the foundry toward the machine shop contains a platform upon which coal and iron for charging the cupolas are delivered by a tram car raised to that level by an elevator arranged for the purpose. This stock is weighed on track scales in front of the elevator. Beneath the cupola platform are the tumbling barrels, convenient to the cupolas for working over the slag, and to the chipping room for cleaning small castings.

The flask room is located at the front, while between it and the tumbling barrel space is the core room, containing a suitable core oven. At the opposite end, facing the yard, is the chipping and pickling room, where the castings brought in from the foundry are pickled, chipped and weighed, before being sent to the machine shop. If the castings are too heavy for convenient handling in the chipping room they may be run through to the yard and there handled by a boom crane covering the tram track upon which they are run into the machine shop. Castings of moderate size, yet too heavy to move by hand, are expeditiously handled by a light overhead trolley hoist in the chipping room.

At one end of the outer bays are the wash room and toilets.

Forge Shop

In the further corner of the yard, as far as possible from the foundry and engine room, is the forge shop, which is reached by tram cars, the track running through its length near the center. On the outer walls are the chimneys for the forges and heaters, and in the rear are the storage sheds for bar iron and steel, and space for coal. These adjuncts are in a shed built with brick walls and of such outline as to conform somewhat to the curve of the railway track, the forge shop having been so located as to admit of this arrangement.

Power House

The power house is located midway in the length of the machine shop, so that power may be applied to the line-shafting at a point that prevents much of the torsion incident to long lines of shafting driven from one end.

Near the boiler house is the chimney stack, with which the smoke flues of all the boilers are connected. Coal is brought in on push cars along the tram track, to the front of the boilers, where a track scale is placed for weighing it. Ashes are removed by the same tram track to whatever point is most desirable to deliver them.

Store House

Across the yard, at the rear end, is a store-house, for finished machines, or product. This connects with the rear end of the machine shop by a tram track running from the scales beneath the traveling crane through a wide doorway and the entire length of the store-house. The rear side of the store-house (next to the railway track) has wide, sliding doors, through which the finished product is readily moved into the railway cars for shipment. Here, as in the chipping room of the foundry, it may be desirable to make use of overhead trolley hoists to facilitate rapid and economical handling of machinery to be shipped. A space is left between store-house and forge shop for a branch of the tram tracks, as a convenient means of receiving material from the railway at this point.

Carpenter Shop

Adjoining the store-house is a carpenter shop. Thus the men who prepare the finished machinery or product for shipping are near their work, and the lumber used for this purpose, and the necessary machinery for cutting it up, are close at hand and require no unnecessary handling.

In the angle formed by the store-house and carpenter shop are the storage sheds for cast iron and steel chips from the machine shop, or for similar material.

Along the side of the yard extending from the forge shop to within 20 feet of the foundry, are arranged the stock sheds. These hold foundry sand and coal, engine coal, coke, etc., which is delivered into them directly from the railway cars, the track being raised to the proper grade after it has passed the store-house. It is continued the whole length of the foundry so as to deliver foundry sand directly into the windows of the foundry, keeping,

that in the storage shed as a reserve supply. Between the storage sheds and foundry is a gate, through which may pass a branch of the tram car track for receiving stock and material from the railway cars at this point.

Provision for Expansion

Whatever may be the size of the buildings of a manufacturing plant, or however carefully provision be made for all necessities for handling materials, etc., there is always the possibility, that some day the works will have to be increased in capacity or changed in form.

It is, therefore, important to consider these points at the outset, and to provide for an expansion of the business in accordance with future needs, and at the same time not disarrange or break up the general plan of the works. With these points in mind, the two following plans are given for enlarging the machine shop when more room is needed.

First, the building may be extended to the rear across the railway track, the rear wall being removed and the traveling crane tracks continued through the length of the additional building. Doors are provided for the passage of cars upon the railway track, and also a specially-built car habitually used for connecting the floors of the old and new building, its platform being on a level with the two floors. Thus the machine shop capacity could be increased to any reasonable extent.

Second, one, two or three bays may be built at right angles to the machine shop and on the side opposite the power house. These might be of one or two stories and of any desired length. They may contain traveling cranes to convey material to and from the traveling crane of the main shop, or have convenient trolley hoists and train car tracks, according to the character of the work to be done.

The capacity of the foundry may be increased one-third by extending it toward the power house. The same space may be obtained by using for foundry space that provided for chipping, core, and flask rooms, and providing space for the latter by extending the building toward the machine shop. The space, occupied by the wash rooms and toilets will, of course, be taken also, and these rooms placed in the gallery, as heretofore suggested.

To obtain additional power space for these enlargements the space occupied by the wash rooms and toilets may be utilized and these rooms provided for in an addition built toward the carpenter shop.

By some one of these plans or a combination of them, the capacity of the works may be at least doubled without seriously disturbing the general plan here described and without impairing the general efficiency of the facilities for handling the work.

This design is in as compact a form as is advisable, with a view of sufficient yard space. Where the amount of land is ample it would be manifestly desirable to spread out the design more by increasing the distance between the machine shop and foundry at the front, and the store-house and forge shop at the rear, or by lengthening the machine shop and thus add to the yard room.

Either of these plans might be employed where the extent of ground would admit of it, as it is always important to have plenty of room when it is possible, and it is seldom that we have too much yard space.

The newest form of shop roof should be of interest, as it tends towards perfect illumination and utility.

Appearance, uniformity, and symmetry have given way to practical usefulness, the object being to secure perfect, or rather as near perfect as obtainable, equal illumination over the entire floor, whether the buildings are large or small.

This has been one of the difficulties not entirely overcome, and in consequence of this drawback it has not been possible to construct buildings beyond a certain width, owing, in this respect, to a dark zone along the center. With this new method of lighting we may practically make them as wide as desired and be assured that the central portion is, for all practical purposes, as well lighted as near the side walls. This is a great advantage in buildings in which large machinery is to be constructed, as this class of work may be much more economically built in shops having but one storey; and as the earth furnishes the best foundation for a floor for heavy weights, this is desirable on that account.

For this class of work a large area is needed, and to construct comparatively narrow buildings in order to have the center of the room well lighted, is expensive as well as inconvenient in moving large machines, or in working around them.

By this method of construction the buildings may be very broad and low and consequently easy to heat, and, as has been said, with good illumination over the entire floor.

The essential feature of the saw-tooth construction consists in forming the roof in broken sections, the roof proper having an inclination of about fifteen degrees, and the glazed portions an inclination of about sixty degrees.

Fig. 1, is a longitudinal section and Fig. 2, a cross-section of a machine shop with this type of roof. In Fig. 3, is given a perspective view of the machine shop completed, showing the general arrangement of the high central portion and the lower portions at each side.

The plan of the building shown is provided with a high central space for an erecting floor, over which a traveling crane is mounted, covering every part of this floor. The side portions are built considerably lower, as the same height is not here necessary or desirable. These portions are provided with smaller traveling cranes, running upon I-beams or girders which project into the central space, so that these cranes are capable of depositing their loads within the reach of, and under the main crane.

If much heavy work is to be done, each of the bays, on both sides of the central portion, is supplied with one of these cranes. By this means any load may be quickly and conveniently transferred from any one point, within any one of the bays to any point within any other bay, or to any point in the central erecting space, by the combined use of the main and secondary cranes.

In many cases it will be necessary to have these secondary cranes on one side only of the central space, the other side portion being reserved for machines and work of the lighter description. So, also, it may not be necessary to equip all the bays on one side, even, with secondary cranes, while it may be necessary, and very convenient, to so equip several bays in this way. The nature of the work may be such that it will be convenient to equip several bays on each side and at one end with secondary cranes so as to arrange all the heavy work across the end of the shop, instead of along the side.

Fig. 1, shows the most approved form of truss for supporting this type of roof, and Fig. 2 gives the form of girders used to support the ridges of the roof where the glazed portion joins the roof proper. This construction is of light structural

FIG. 1.

FIG. 2.

steel and no more members are used than is absolutely necessary, hence the entrance of light is very slightly interrupted and still there is sufficient strength for all practical purposes. The glazing of the light portions should receive much attention, in order to avoid leakage, as this is always one of the drawbacks of any kind of inclined windows.

For purposes of ventilation the sashes may be hinged at the top and opened by any convenient means. A simple device is to run a light shaft along inside the building and near the bottom of the sashes, and fix to it cast iron arms, in the form of cranks, for each sash. From these arms connecting rods run to the sashes. This shaft may be operated by fixing to it a grooved pulley, over which a small rope runs, and reaches down near the floor, from which it may be operated.

Ribbed glass should be used in these sashes as it prevents the glaring effect of direct and unimpeded sunlight, and diffuses a soft and agreeable light over the whole area to be lighted.

The roof timbers should be secured to the walls and to the posts by anchor bolts, to prevent the roof being lifted by high winds. In putting on the roof planking for this type of roof different methods must be adopted for the steel construction from that used for wood trusses and roof timbers.

In the case of the steel trusses, the supporting bars are shown in solid section in the longitudinal section, Fig. 1, and to these the planks may be secured by bolts, or lug screws, if steel supports are used, or by spikes, if these supports are of wood. In either case the planks will run in the direction of the pitch of the roof.

If the wood construction is used, the rafters will not be over 10 feet centers, and the planks long enough to reach at least two spaces, or 20 feet, ,and are spiked directly to the rafters, consequently they will run at right angles to them.

In case of either steel or wood construction, the roof planks should be covered with a good resin-sized roofing paper, mopped with hot tar, and upon this a heavy quality of roofing tin, or some form of the modern sheet steel roofing. All sheet metal should be painted on the under side before it is laid.

The gutters or valleys of these roofs should be the subject of careful attention. They need not be of sharp pitch, as a quarter of an inch to the foot will be sufficient. Conductor pipes at each gutter should carry off the water. In the case of the shop shown in perspective in Fig. 3, the gutters on the high central portion should incline each way from the center and from each side, conductor pipes carrying the water to the gutters in the lower part of the building, and from thence it flows to the conductor pipes at the sides.

Both of the methods above described for constructing the roof will be found economical to build and well adapted to the purpose for which they are to be used.

FIG. 3.

DEVELOP FLUORSPAR MINE IN B.C.

"The Consolidated Mining & Smelting Co. have started development of the fluorspar deposit which they bonded on the north fork of the Kettle river," writesA. E. Haggen. "This is one of the most important mineral discoveries recently made in the province of British Columbia. It is used in the manufacture of hydrofluoric acid, of which a large amount is consumed in the electrolytic lead refinery at Trail, and as a flux in silver-lead and copper ores. With the establishment of the iron and steel and glass-making industries in British Columbia the existence of fluorspar will prove of great value. In the smelting of iron and steel fluorspar and phosphorus contents, and increases the tensile strength of the metal. Other uses are in the manufacture of spiegeleisen, foundry work, cupola, furnaces, manufacture of enamels, glazes, fireproof ware, apochromatic lenses, gems and carbon electrodes folr flaming arc lamps, so that the discovery of this deposit is not only of value in existing metallurgical industries, but in the future industrial development of the province. A good deal of the mineral has already been packed out on horses, but a road is being built to connect the deposit with the railway, a distance of about eight miles.

"'A tunnel is being driven on the Molly Gibson at Paulson. This property carries an appreciable amount of platinum in addition to the other mineral values."

STEEL SITUATION IN JAPAN

The steel rolling mill of the Kawasaki Dockyard Co. at Fukai, Kobe, will begin operations in a few days. The plant has a capacity equal to turning out 125 tons a day.

The Hokkaido Steel Works has completed the installation of a smelting furnace with a capacity of 100 tons a day. The new furnace was to start operations on Saturday, June 15.

It is reported from Osaga that France and Italy have started their purchase of Japan zinc, thereby enlivening the market here, which has been short of the visible stock on account of the curtailed output of refiners.

Big zinc refiners in Japan, including the Mitzui Co., Suzuki & Co., and others, are going to boost up prices of zinc by their united action to cut down the output. The probable extent of reduction is 25 per cent., it is said.

WOOD SHIPS FOR AUSTRALIA

The Canadian government has received an interesting statement in regard to the present position of shipbuilding by the Commonwealth of Australia. Actual contracts entered into by the government include 26 steamships and twenty-four wooden ships, with a gross tonnage of 200,600 tons. Twenty-seven distinct slips are bieng used for construction purposes. When these contracts are completed the Australian government will own a total fleet of seventy-seven vessels of a gross tonnage of 302,506 tons. Of this number fourteen vessels have been purchased in England and fourteen are being built in the United States.

At least one Nova Scotian vessel will, in all probability, be purchased by the Commonwealth government within an early date. The report states that as it is impossible to obtain adequate supplies of wire rope and the favored hemp sail canvas from the United States, the attention of Canadian manufacturers of these articles is directed to the development of Australian shipbuilding as an outlet for their products.

FLINT AND TINDER AGAIN

The manufacture of tinder-box flints is booming just now owing to the match shortage.

This is probably the oldest handicraft in Britain—older, in fact, it could hardly be, for it forms an industrial link—the only one—with the prehistoric Stone Age.

The centre of the industry is the little village of Brandon, on the borders of Norfolk and Suffolk. The men who pursue it are known locally as flint-knappers, and the work is done in little sheds, often situated at the back of the cottages in which the workers live.

In pre-war days the demand for the flints they produced came chiefly from Spain and Italy, in the rural areas of which countries the old-fashioned flint-and-steel tinder-box has never been wholly supplanted by the modern match. But nowadays practically the entire supply is eagerly snapped up by the makers of those ingenious little mechanical devices for lighting pipes and cigarettes with which the war has rendered us familiar.

Rust Spots Turned Out to be Only Oil Stains

Peculiar Problem Came Up in Large Montreal Plant, Where Inspector Was Sure There Was Defect, While Superintendent Held His Shop's Work Was Well Done—Oil Was the Cause

ONE of the many causes of rejected shells has been the appearance of what the inspectors term "rust spots" on the walls of the bore. Inability to state definitely the causes of the formation of these spots has resulted in the holding up of finished shells until the objectionable feature has been removed, or until a district inspector has permitted the shells to pass. A notable instance of this was brought to the attention of the wrier some few weeks ago by the superintendent of a large munition plant manufacturing 6 inch high-explosive shells. After mastering all the details in connection with the machining of the shell the work of production was proceeding with increasing regularity when the presence of these so-called "rust spots" was discovered by the inspector, and, despite all argument or contention on the part of the plant officials that the shells were almost perfect, the inspector insisted that shells showing such blotches could not be accepted.

Searching for the Trouble

Certain that these spots were not detrimental to the shell or its subsequent action, the superintendent determined to investigate and convince the inspector that such shells were as perfect in every particular as any others passing inspection. On closely examining several of the shells that had been turned down, it was invariably found that these objectionable blemishes were located about midway of the length of the shell bore. Further investigation showed that in few instances did these spots appear near the nose or at the base of the shell. Believing that rust spots would not be confined to any particular portion of the shell, the superintendent set to work to find out just what would cause these spots to appear. Carefully studying the various operations through which the shell passed it was thought that during the process of nosing was the most likely period in which the spots would be created.

Lubrication of Nosing Die

As is generally known it is the practice to swab the bottling die with oil to lubricate the surface to facilitate the operation and avoid undue wear upon the die. The use of oil also assists in the release of the shell after the nose has been formed, the sudden heating of the oil causing a gas to form in the shell, and the rapid expansion of this gas tends to eject the shell from the die.

Believing that here might be found the seat of the trouble, a close study was made of the possibilities resulting from the presence of this oil on the interior of the shell. As might be expected, when the workmen are lubricating the die, little attention is given to the amount of oil swabbed on, so that a splash is very likely to find its way into the open end and lodge on some section of the inner wall. In the heating of the shell prior to nosing, the open end is placed in a special furnace, and for a distance of approximately three inches is heated to a forging temperature. This high temperature is confined to the portion subjected to nosing, but the heat cannot be stopped at a definite line, and consequently the temperature gradually lessens towards the base of the shell.

Conclusions Arrived At

Accepting this as a basis of operations three distinct conditions were arrived at; first, the heat at the extreme nose was so great that a splash of oil on this portion would immediately burn off, leaving no trace of oil or carbon content; second, the portion near the base was comparatively cool, so that oil falling on this section would remain virtually in a normal state, being subsequently removed by the sand-blasting or washing process; third, the portion midway between the heated nose and the base would be of such a temperature that the liquid portion of the oil would be burned off but the heat not sufficient to consume the carbon content, this being deposited into the pores of the metal in such a manner that the spot affected would take on a different color to the surrounding metal, creating the condition that had given rise to the "rust spot" theory.

Attempts had been made to eliminate these spots by sand-blasting but little success could be accomplished, the only result being to produce a slight hollow at the affected spot.

Proving the Theory

To prove the conclusions arrived at from the study of the nosing operations, two shells were carefully selected that were practically identical in every particular, with the bores of both perfectly clean and smooth. The nosing die was cleaned and all trace of oil removed, the shells heated and bottled in the usual manner, without lubricating the die. One of these shells was afterwards placed in a furnace and the entire shell heated to a temperature corresponding to that generally attained midway of the length when the ordinary nosing process is performed. This shell was then swabbed with oil over the entire surface of the bore and allowed to cool. When cold these two test shells were cut in half, lengthwise, for close examination.

When these were closely inspected separately, one could not detect any difference between the walls of the shells, but when the four halves were placed together the contrast was quite striking, the surface in each case being quite clear and uniform, but the shell that had been treated with oil was of a slightly darker color than the other. One of the "rust spotted" shells was also cut in a similar manner and carefully examined in conjunction with the test shells, and the contrast between the rust spot or stain was exactly the same as that of the two shells treated for experiment. Little difficulty was experienced after this regarding the presence of these oil stains.

COMPRESSED AIR FOR CLEANING MOTORS

By Meredith.

In a great many manufacturing plants, especially those working in wood or a similar material, the driving motors have a tendency to become clogged with dust in a short time. Such accumulation of dust is a fire hazard, particularly if the motors are overloaded and liable to have coils burn out; and if a motor is not overloaded it may heat if the air ducts are filled with dust. Moreover, the motor is not able to carry the peaks when called upon, for the reason that the additional heat cannot be dissipated. Motors should be cleaned frequently, but such cleaning with the means ordinarily at hand is a rather difficult procedure since the air ducts are necessarily usually small and difficult to clear with a brush. The windows may be brushed off externally but such cleaning does not reach the real seat of the trouble.

One of the best methods is compressed air under considerable pressure. If the air is not available from some source already in use, it is advantageous to use a small motor driven compressor and a storage tank. The compressor should have a capacity of from 4 to 10 cubic feet of air per minute at a pressure of 100 pounds per square inch, and the tank should hold from 40 to 100 cubic feet. This size will take care of the average plant.

In piping a factory the air line can be in 1 in., ¾ in. and ½ in. pipe. Since the amount of air used in cleaning any one motor is small, a large pipe is not necessary. An outlet with a valve should be placed near each motor, or if they are grouped, several motors can be reached from one outlet with ½-inch or ⅜-inch hole. The smaller size is more easily handled. The nozzles can be made up of bras rod of suitable sizes and shapes, which, however, must have very small openings, as a large nozzle opening would consume too much air. Probably the most useful sizes would be 3/32 inch, 1/16 inch, and 3/64 inch, and these three nozzles will meet most conditions.

Sometimes it becomes desirable to clean surfaces with air; for instance, the walls or ceilings of the buildings. This may be done with a tool made from ⅜-inch or ½-inch pipe in which there are a number of holes, to form a "brush" of escaping air. For ordinary purposes holes of about 1/32 inch to 1/64 inch can be used.

These small nozzles do not clog readily if all the scale and dirt is blown out of the piping. As an investment such a cleaning system will be found to pay for itself in the reduction of motor troubles and the decrease in fire hazard.

OILS AND THEIR USES

By M. M.

EVERYONE knows scomething about the usefulness of oils in the workshop, but there are a great many who employ them indiscriminately, thereby making more or less serious mistakes. A little general understanding and commonsense is necessary, and also a little discernment as to the nature of the oils which are useful in everyday use. A very common mistake is to oil a sewing machine, bicycle, pram or clock with any kind of oil which happens to be handy. Frequently these are oiled too often and yet again they are oiled too seldom, being left till they squeak. Then they are given too much oil, often of the wrong sort, and then there is more trouble. The right oil to use for a clock, no matter what sort it is, is clock oil, which is a clean, thin lubricating oil that does not dry or get sticky. It is also suitable for any light machinery. The least possible touch of oil on the working parts only of clocks will suffice, and as the movements are slow, they do not need it often. Now if this oil were used for sewing machines and the like, they would require it too often, so a machine oil with more body is best used very lightly, but as frequently as may be needed to keep all the parts slightly greased. Fast-running machinery requires oiling the oftenest. Whereas once a year might do for a clock, once a day would be necessary for a machine in constant use. And the heavier the machinery the heavier the oil should be; engine oil is really heavy machine oil.

Linseed oil, in appearance, might seem to be a good lubricant; but it is altogether unsuitable. It dries like a hard varnish, and, of course, would clog any machinery almost as badly as varnish would, except that it hardens slowly. If a piece of rag that has been used in apers oil, and another wet with linseed oil, be left exposed to dry air for a considerable time, the former will be still the same, but the latter will have become stiff and heavy. For this reason it is quite unfit for using on hones and whetstones when sharpening tools, for it makes them hard and useless, but it is always around woodworking shops, and thus many workmen have spoilt their stones before finding the reason out. If used for oiling the bright blades of saws or other tools, it makes them brown and varnishy. But linseed oil is the very best for rubbing into the wood parts of tools to keep them clean, and it imparts a hard, finished surface. For woodworking and polishing it is invaluable; also, in the manufacture of varnishes, oilcloths and imitation leathers. Boiled linseed oil is the only kind for mixing paint; or it would never dry. It is also essential for making putty; the best is made from raw linseed oil and whiting. Very often cotton-seed oil is used as a substitute for linseed oil but is a very poor substitute. Linseed oil is useful for domestic purposes in reviving varnished furniture and leather goods. It is sometimes employed for machine belting, but castor oil is considered best for the purpose, also for the leather of bellows and such like articles, where suppleness and durability are required. As it is expensive, however, palm oil makes a good substitute.

Petroleum or paraffin, besides being the recognized burning oil for lighting and heating purposes, is excellent and cheap for cleaning the working parts of machinery before lubricating. It is good for thinning down machine oil before lubricating and makes a capital lubricant for locks and light machinery, if a little sperm oil is added. For sharpening tools on the whetstone, many workmen prefer it to any other.

THE INSPECTION DEPARTMENT

By M. R.

In the days before the war the engineering shop with an inspection department and a special staff charged with gauging and measuring each article produced, to see that it conformed to a minimum standard of accuracy, was regarded as a rather "advanced" concern. In the vast majority of general engineering shops the foreman kept a more or less vigilant eye on the work sent forward by his department, and the manager, personally or by proxy, inspected a finished job before despatch; but otherwise, the responsibility for seeing that faulty work was not turned out rested on the workman himself. He worked to a standard prescribed by his skill and self-respect, and the fear of bad work being found out and reported upon either by some other department or by the customer kept him up to the mark. But the war has changed all that. It has changed engineers into manufacturers of interchangeable parts, which stand to be rejected if they are not up to size within the plus and minus limits prescribed. In these circumstances it pays to set up a system of inspection whereby every patch of work is examined, for by so doing, faulty work can be discovered at once, and the man or machine promptly attended to. An instance of the saving effected by proper inspection is given by Mr. C. Turtle in an address to the Junior Institution of Engineers. A firm undertook a contract to supply half a million of a certain piece of ordnance mechanism, which involved something like 200 machine operations. For the first 100,000 the rejections were between 12 per cent. and 15 per cent. and it was soon realized that there was something seriously wrong. It was decided that the manufacturing side was all right, but that the inspection organization as it then existed, was not up to the new requirements. An inspection department and staff was therefore created, with the result that in the second contract for a further half million, the Government rejections dropped to 0.17 per cent. For the last 300,000 parts delivered under the contract the Government rejections only amounted to 0.034 per cent., which is believed to constitute a good record. That these exceedingly good figures were not obtained at any undue expense in material rejected at the works, was proved by the fact that the works scrap only amounted to 4 per cent. of the metal cut up. The improvement was obtained by prevennot only entailed an investigation of the gauges in use, but of them ethods by which they were handled and used, the machine operations and the personnel of the whole department. The practice of inspection, though vastly extended by the multiplication of war orders, will certainly not subside with the end of the war, for, quite apart from the execution of orders having size limit specification clauses, there are great economies in working to a proscribed degree of accuracy. Mr. F. W. Lanchester gave a good instance of this in his paper on worm gearing. Some years ago in designing certain mechanism Mr. Lanchester himself set every clearance dimension and tolerance dimension and these were worked to for a considerable time with satisfactory results. A new works manager, who did not believe in working to fine limits, reported that the limits were unduly fastidious, and that money could be saved by relaxing the limits and so avoid having to scrap part. The managing director consented, and the scheme was tried. A slight and questionable reduction resulted in the cost of manufacturing components, but the increased cost of assembling and testing, and the cost of rectifying complaints, etc., became so great that the initial saving was swallowed up many times over. Within twelve months the scheme was abandoned, and the old fine tolerances were restored, the expense of twice altering the gaugs, etc., being a dead loss, apart from the disastrous results of the experiment. It is but another instalment of the old story that what is gained by scamped work in the machine shop may be lost ten times over by extra work on the fitter's bench.

Hints on Steel.—Sanderson Bros. and Newbold Ltd., of Sheffield, England, have recently published a new issue of this instructive little 96 page booklet, covering all the essential details in connection with the working, hardening and tempering of their various grades of light speed and carbon steels. This booklet is very complete and will be found of great value to steel users. H. A. Drury Co. are the Canadian distributors.

Rapid Growth of Canadian Railway Club

At Present Time There is an Enrollment of 883 Members—Forty-five Members Are Now Overseas, and the Club Has Been Active in War Work at Home

THE Canadian Railway Club with headquarters in Montreal has made rapid progress during the past few years, both in the strength of the membership and the services the club has been able to render these members. The club has at the present time an enrollment of 883 members.

Over 45 members have enlisted for overseas' service, five of whom have since been killed in action, three wounded and returned. The retiring president, G. E. Smart, was untiring in his earnest enthusiasm throughout the year, and the success of the past season has been due very largely to his energetic leadership and that of his lieutenants. The papers and discussions of the sessional period were very instructive and educational in character, dealing particularly with subjects pertaining to problems created by existing abnormal conditions in connection with railroad work and organization; these papers were prepared by prominent railroad men in various branches of the service.

The inauguration of the Canadian Railway Club took place early in 1902. The advantages that would result from the formation of a society for the better education and co-ordination of its members was recognized by several local railroad officials who had previously experienced these benefits from similar institutions in the States. The preliminary meeting of the club was held on the 15th of February at the Queen's Hotel, Montreal. Prominent amongst those responsible for the initial movement were E. A. Williams, W. H. Rosevear, S. S. Underwood and M. P. Kelley. A general meeting was called for the 11th of March at the Windsor Hotel, at which the new Railway Club was organized and a committee appointed to draft out a constitution and the necessary by-laws. Twenty-six representative members were present at this meeting and the club started out with approximately 175 charter members. The first officers of the Canadian Railway Club were E. A. Williams, Supt. of Rolling Stock, C.P.R., president; T. A. McHattie, Master Mechanic, G.T.R., 1st vice-president; S. King, Master Car Builder, I.C.R., 2nd vice-president; M. P. Kelley, Chief Clerk Car Dept., C.P.R., secretary; S. S. Underwood, Draughtsman, G.T.R., treasurer. The executive committee were W. H. Rosevear, Jr.; Jas. Powell, T. H. Hopkirk, F. Sutherland and Acton Burrows.

Objects of the Club

The principal objects of the Canadian Railway Club are given in sections 1 and 2 of the constitution; first, the object of the club shall be the dissemination by means of reports, papers, investigations, and the discussion of knowledge concerning the construction, operation, and maintenance of railroads and railroad equipment, and the cultivation of sociability among its members. Second, no patentees or their agents or agents for the sale of railroad supplies, shall occupy the attention of any club meeting in the interests of the device in which they are personally or financially interested, unless they are especially invited to do so by a majority vote of the members present, or by consent of a majority of the executive committee, and the article they represent forms a part of the subject of discussion.

The Officers For 1918

The officers elected for the ensuing year were as follows: President, C. W. Van Buren, Gen. Master Car Builder, C.P.R., Montreal; 1st vice-president, T. C. Hudson, Master Mechanic, C.N.R., Joliette; 2nd vice-president, J. Hendry, Master Car Builder, G.T.R., Montreal; executive committee: W. H. Winterrowd, Chief Mechanic Engineer, C.P.R., Montreal; C. H. N. Connell, Division Engineer, C.N.R., Montreal; Arthur Crumpton, Asst. Valuation Engineer, G.T.R., Montreal; E. A. Nix, Asst. Works Mgr., C.P.R., Montreal; W. H. Sample, Supt. of Motive Power, G.T.R., Montreal; B. F. Shortley, Terminal Agent, I.C.R., Montreal.. Audit committee: D. R. Arnold, Sales Manager, Can. Car & Foundry Co., Montreal; Geo. Whiteley, Asst. Supt. of Motive Power, C.P.R., Montreal; G. M. Wilson, Master Mechanic, G.T.R., Montreal. Treasurer, E. E. Lloyd, Auditor of Disbursements, C.P.R., Montreal. Secretary, Jas. Powell, Chief Draughtsman, G.T.R., Montreal.

C. W. VAN BUREN, PRESIDENT

General Master Car Builder, Canadian Pacific Railway, Montreal

Starting his engineering career with the New York Central in 1889 being employed in the West Albany Car Shops. In July, 1905, he accepted a position with the Canadian Pacific Railway, as General Car Inspector. In 1906 he was appointed Divisional Car Foreman of the then Eastern division. He was appointed Master Car Builder of the Eastern lines, in the year 1909. He left the C.P.R. in 1911, to accept a position with the Union Stock Yards and Transit Co., of Chicago, Ill. Returned to the services of the Canadian Pacific in April, 1915, to the position of General Master Car Builder, with headquarters at Montreal.

GEO. E. SMART, PAST PRESIDENT

Master Car Builder, Canadian Government Railway, Moncton, N.B.

Started his mechanical career with the Grand Trunk Ry., in 1895, and in 1904 he left to accept a position as Supervisor of car heating and lighting with the Canadian Pacific Railway. He was appointed to the position of General Car Inspector in 1906. Three years later he was promoted to Divisional Car Foreman of the Eastern division. He resigned from the C.P.R. in October, 1913, to accept the position of Master Car Builder of the Canadian Government Railways, and has recently been promoted to Superintendent of the Car Department.

T. C. HUDSON, FIRST VICE-PRESIDENT
Master Mechanic, Canadian Northern Ry., Joliette, P.Q.

Born at Brockville, Ont., February 20, 1873; educated at Brockville and the Carleton High School. Started apprenticeship as machinist in January, 1887, with the Canadian Pacific Railway at Carleton Place. Served as a general machinist for the C.P.R. at Chapleau, Carleton Place and other points until 1901, when he was appointed Asst. Roundhouse Foreman for the C.P.R. at Smiths Falls, retaining this position until 1903. From then until January, 1906, he was foreman of general repair shops at Carleton Place, and for the next year was Locomotive Foreman for the C.P.R. at Ottawa. He resigned from the C.P.R. in January, 1907, to accept the position of Shop Foreman with the Canadian Northern at Parry Sound. In July, 1907, he was promoted to Master Mechanic of the Canadian Northern Quebec Railway, and the following year had the additional duties of the Quebec and L. St. John Railway. In August, 1915, he was appointed Master Mechanic of the C.N.R. system lines east of Ottawa, with jurisdiction extending over the Car Dept., this being his present position.

J. HENDRY, SECOND VICE-PRESIDENT
Master Car Builder, G.T.R., Montreal

Mr. Hendry has been employed as Master Car Builder of the Grand Trunk Railway, for the Eastern lines, with headquarters at Montreal since 1908. Previous to this he had served for a number of years with the Canadian Car and Foundry Company at Montreal, in charge of the passenger car construction department.

W. H. WINTERROWD, EXECUTIVE COMMITTEE
Chief Mechanical Engineer, C.P.R., Montreal

Born at Hope, Ind., on April 2, 1884, being educated at Shelbyville, Ind., and Purdue University, whence he graduated with the degree of B.S. in 1907. He entered railroad service in 1905, the first year as a blacksmith's helper for the Lake Erie and Western Ry. at Lima, Ohio; from 1906 to 1907 he was air brake and car repair man for the Western lines of the Pennsylvania Railway at Dennison, Ohio. The following year he served as special apprentice with the Lake Shore and Michigan Southern Railway at Elkhart, Ind. From 1908 to 1909 he occupied the position of roundhouse foreman for the Lake Erie, Alliance and Wheeling Railway at Alliance, Ohio, and the next year was transferred to Youngstown as night foreman of the roundhouse for the Lake Shore and Michigan Southern Railway; the next year serving as roundhouse foreman for the same road, at Cleveland, Ohio, and from 1910 to Sept., 1912, he acted as assistant to the Mechanical Engineer at Cleveland. He then accepted a position with the C.P.R. as Mechanical Engineer of the Angus shops at Montreal. In May, 1915, he was appointed assistant to the Chief Mechanical Engineer, and on April of this year was promoted to the position of Chief Mechanical Engineer.

CHAS. H. N. CONNELL, EXECUTIVE COM.
Division Engineer, Canadian Northern Railway, Montreal

Born in Woodstock, N.B., August 26, 1876, and received his early education in the Woodstock Grammar School. His railway career commenced in 1897 when he engaged as a rodman on construction and survey for the Crow's Nest Pass Railway (C.P.R.). The following year he was a topographer on survey of the Rainy River Railway (C.N.R.). He was appointed roadman on construction for the same company in 1899. In 1900 he accepted a position as roadman on construction and Assistant Resident Engineer with the Algoma Central and Hudson Bay Railway and was promoted to Resident Engineer of the same road in 1901, retaining this position until 1903, when he accepted a position as Assistant Resident Engineer with the Halifax and South Western Railway. From 1903 to 1906 he was engineer in charge of Surveys and Maintenance with the Alberta Railway and Irrigation Company of Lethbridge, Alta. For the next three years he held the position of Chief Engineer for the same company. In 1909 he was appointed Engineer of Maintenance of Way, on the Quebec division of the Canadian Northern Railway. In 1914 he was appointed Divisional Engineer, and last year was given the office of District Engineer with headquarters at Montreal.

EDWARD A. NIX, EXECUTIVE COMMITTEE
Assistant Works Manager, Canadian Pacific Railway, Montreal

Born at Columbus, Ga., August 23, 1872. Entered the service of the Central of Georgia Railway at Columbus, Georgia, at the age of 18, as apprentice car builder. After finishing term of apprenticeship worked for a time as journeyman car builder and was subsequently promoted to Freight Inspector, Passenger Inspector, foreman of car cleaners, and assistant foreman of the car shops. In June, 1897, he was transferred to Macon, Georgia, succeeding S. A. Charpiot, as Master Car Builder. In May, 1905, he was appointed manager of the Lenoir Car Works, Lenoir City, Tennessee. Here he remained until September, 1907, when he accepted a posi-

tion with the Bodley Wagon Co., Memphis, Tenn., being appointed vice-president and general manager of the company. Re-entered railway service again in Sept., 1911, taking charge of the Car Dept. of the Illinois Central Harnham shops at New Orleans, La. He was transferred to Memphis, Tenn., in the same position, in February, 1913. Entered the services of the St. L. & S. F. Ry. at Memphis in May, 1915, in charge of the car department. In November of the same year he was again transferred to Kansas City, Mo., as Car Superintendent of the Northern Division. He accepted his present position as Asst. Works Manager of the Car Dept. of the C. P.R. at Montreal in April, 1916.

ARTHUR CRUMPTON, EXECUTIVE COM.

Assistant Valuation Engineer, G.T.R., Montreal

Is a native of Toronto and has been with the engineering department of the Grand Trunk for many years in responsible positions connected with the locating of new lines, as well as in the designing and superintending of construction of many important engineering works for the railroad and its subsidiary lines.

W. H. SAMPLE, EXECUTIVE COMMITTEE

Superintendent of Motive Power, G.T.R., Montreal

Was born at Altona, N.Y., August 20th, 1864, and entered railroad service on his birthday anniversary in the year 1882. For five years he was a fireman with the Central Vermont Ry. at St. Albans, Vermont. From 1887 to 1890 he was locomotive man with the Atcheson, Topeka and Santa Fe Ry. at Albuquerque, N.M. He returned to the Central Vermont as locomotive man and after one year was appointed to the position of Road Foreman of Locomotives, remaining in this position until 1906. He then resigned to accept a position as Superintendent of Motive Power and Car Dept. with the Northern Railway of Costa Rica (United Fruit Co.), San Jose, Costa Rica. He then came to Canada and on March 15th, 1911, he was appointed to the position of Master Mechanic for the Grand Trunk at Ottawa. From October, 1914, to October, 1916, he was Master Mechanic of the G. T. R. at Battle Creek, Mich. He was then transferred to Montreal as Master Mechanic of the Eastern lines, and in the spring of 1918 was appointed Superintendent of Motive Power with headquarters at Montreal.

B. F. SHORTLEY, EXECUTIVE COMMITTEE

Terminal Agent, Intercolonial Ry., Montreal.

Born in Montreal on June 24th, 1866. His railroad career commenced in 1887 when he engaged as a switchman with the Grand Trunk Ry,. being subsequently promoted to Operator and then to Train Despatcher. In May, 1900, he accepted a position as operator with the Canadian Government Railways, and was afterwards appointed to take charge of the Commissionary Department at Montreal. He was in charge of the stores department for a number of years and for the past five years has been the Terminal Agent at Montreal.

D. R. ARNOLD, AUDIT COMMITTEE.

Sales Manager, Can. Car & Foundry Co., Montreal.

Started his mechanical career in 1904 with the Barney and Smith Car Co., of Dayton, Ohio, in the mechanical department. He was transferred to the estimating department in 1910 and the following year was promoted to assistant to the President. On the first of March of the same year he accepted a position in the estimating department of the Canadian Car & Foundry Company of Montreal, and in 1914 was appointed Sales Manager for the company.

GEO. WHITELEY, AUDIT COMMITTEE

Asst. Supt. of Motive Power, Can. Pacific Ry., Montreal.

Born March 2nd, 1880, in the city of Toronto. Educated in the Toronto Public Schools, the Allandale Public School and the Barrie Collegiate Institute. Started his mechanical career as a call boy for the Grand Trunk Railway at Allandale in September, 1895. From March, 1896, until August, 1902, he served as wiper and fireman for the Canada Atlantic Railway. In Sept., 1902, he engaged as fireman with the C. P. R. operating out of Fort William. Transferred to Moose Jaw in January, 1903, and in March of the same year was promoted to engineer, located at Moose Jaw until Sept., 1909. He was then appointed Road Foreman of Engines, retaining this position until June, 1911, being then appointed to the position of District Master Mechanic with headquarters at Moose

Jaw. From January, 1913, to January, 1915, he was Master Mechanic at Calgary, following which he was appointed to his present position as Assistant Superintendent of Motive Power with headquarters at Montreal.

G. M. WILSON, AUDIT COMMITTEE

Master Mechanic, G. T. R., Montreal

He was born in Belfast, Ireland, on the 5th of October, 1867, of Irish and Scotch parents, and came to this country in 1880. After serving an apprenticeship to the machinist's trade he entered the service of the St. Clair Tunnel Company, in connection with the construction of the St. Clair tunnel, during the years 1889 and 1890, and afterwards was employed by the Jenks Shipbuilding Company at Port Huron, Michigan. After remaining with this firm for a brief period he entered the services of the Grand Trunk Ry. at Fort Gratiot, as a machinist, on the 11th of November, 1890, and subsequently filled the various positions of expert machinist, machine shop foreman, general foreman of the Toronto shops, general inspector of tests over the System, assistant Master Mechanic of the Montreal shops, and was appointed master mechanic on the 1st of Sept., 1917. In the year 1907 he was intrusted with the layingout and supervising the installation of the entire machinery equipment of the main shops of the Western Division at Battle Creek, and on the completion of this work he was transferred to Ottawa to supervise and install the power house equipment in connection with the new station and the Chateau Laurier.

E. E. LLOYD, TREASURER

Auditor of Disbursements, Canadian Pacific Ry., Montreal

Entered the services of the Canadian Pacific Railway as a clerk in the Stores Department at Winnipeg, on Dec. 27th, 1887. Was appointed chief clerk of the Stores Dept. at Vancouver, on Dec. 17th, 1897. Transferred to Montreal on Feb. 1st, 1903, and given the position of Chief Clerk and General Storekeeper. The two departments were subsequently divided and Mr. Lloyd remained with the accounting dept. as chief clerk. He was transferred to the auditing department of stores and mechanical accounts in January, 1905, Assistant Auditor on January 15th, 1910, and Auditor of Stores and Mechanical Accounts in August, 1913. He was appointed to his present position of Auditor of Disbursements on the 18th of March of this year.

JAS. POWELL, SECRETARY

Chief Draughtsman, Motive Power Dept., Grand Trunk Railway, Montreal

Mr. Powell was born in England, serving his apprenticeship with Sharpe & Stewart Company, Ltd., locomotive builders, Manchester. He served in various capacities with different English firms, noteably the Naysmith Co., of Patricroft, Lancashire; the Vulcan Iron Foundry at Earlstown; and also the Lancashire and Yorkshire Railway, Manchester. He came to Canada about 1880 and for the past thirty-seven years has been with the Grand Trunk Railway occupying the positions of leading draughtsman and later as Chief Draughtsman of the company. Much credit is due him for the efficient training of the apprentices throughout the entire system. He has occupied the office of Secretary of the Canadian Railway Club for the past 13 years.

LAYING OUT INVOLUTE TEETH FOR CAST GEARS.

SIMPLE CHART TO ELIMINATE FIGURING OUT CAST GEAR TEETH

The use of gears with cast teeth is common practice in many classes of machinery where absolute accuracy of operation is not essential, but to derive the maximum efficiency from a pair or train of cast gears it is necessary that the profile of the tooth should conform very closely to the desired shape to insure smooth and steady running. The accompanying chart was designed to facilitate the laying out of the teeth on the pattern, eliminating the necessity of calculating the various dimensions for the different sizes of gears and circular pitches. In order to make the chart of practical value the reproduction has been made to meet actual working requirements so that the dimensions can be taken directly off the chart and transferred to the work. However, it might be well to describe the construction of the chart so that those desiring to develop one for their own use can readily do so. It will be noticed that the principle is one of simple proportion, so that the same straight oblique line serves as a basis for the various dimensions of the teeth on different pitch gears.

The base line C-D can be drawn to any length but in this instance it has been given a length of 6 inches, so that the dimensions on the vertical line A-B, drawn perpendicular to the base line, from the 6-inch intersection, will be for a gear having teeth with 6-inch circular pitch. The clearance is generally taken as 1-16 of the working depth, the whole depth being approximately .6866 of the circular pitch. The thickness of the tooth, on the pitch circle in cast gears, is always narrower than the corresponding space. This difference will range from 3-64 inch in small pitches to 1-16 inch in the larger pitches.

An application of the use of the chart is shown above. The teeth on each gear would, of course, be laid out separately, but for sake of illustration they are shown here in mesh, the same principle applying in either gear or pinion. Two essential details are required before the tooth profile can be determined, namely, the length of the generating radius of the tooth face, and the position of the base circle from which the tooth shape is struck. To obtain these, proceed as follows: On the center line K-L lay off the centers M and N of the two gears, this distance being determined by the size and ratio of the gears. When the same has been found, strike off the pitch circles O-P and Q-R tangent to each other and intersecting the center line at the point S. Through this point draw the line T-V at an angle corresponding to the pressure angle desired, either 14½ or 20 degrees—the 14½ degree being the most common pressure angle, while the 20 degree method is sometimes adopted where gears are subjected to heavy duty and give a tooth with a thicker root and therefore a much stronger tooth—the latter being used in this particular instance. Through the centers M and N, and perpendicular to the pressure line T-V, draw the lines M-V and N-W.

We are now ready to lay off the teeth. Owing to the fact that the circular pitch is measured on the arc of the circumference of the pitch circle, it is desirable first to divide the pitch circle into the desired number of equal divisions to suit the number of teeth required. Then from each divisional point strike off the thickness of the teeth. From the center N, and with a radius equal to the distance S-W, describe the base circle 1-2. Now, with a radius equal to N-W, and from the points on the pitch line, giving the thickness of the teeth, as at S-Z, find the generating points, and with the radius N-W describe the arcs that form the faces of the teeth. A prolongation of one of these is shown at 3-4.

The same process is used for laying out the tooth shapes on the pinion, M-V being the length of the generating radius, V-S the radius of the base circle 5-6, the generating points being found as described for the large gear. In every case the arc of the tooth face is drawn from the outside circumference to the base circle, the remainder of the tooth profile being a radial line to the bottom of the working depth. A fillet, as large as conditions will permit, is then struck to form the connection between the flank and the root of the tooth space—usually equal to the clearance.

CUTTING THREADS ON SCREW MACHINES ON BAR STOCK AND CASTINGS

By P. W. BLAIR.

It is a well known saying among lathe-hands and machinists that "if you want a good and perfect thread it must be cut in a lathe."

It is true that a good lathe hand, if he is a first class man, can produce a fine thread on an engine lathe or screw cutting lathe with a special attachment, but it is an expensive operation grinding and setting a single pointed tool until it is at a correct angle and then finishing the piece until it is perfect.

The man next to him not as good a mechanic gets the same or more uniform results about three times as fast by roughing the thread down and sizing by running a die over the thread.

These methods giving good results are slow and expensive. The practical screw machine operator who has given the use of dies a careful study will be able to produce as good results when using a die to complete the thread entirely, if it is made correctly, at a fraction of the cost of lathe work on bar stock or castings. There may be other screw machine operators around him who may fail on the same work unless poor rough torn threads will pass inspection. In the past three years, owing to so many parts being made as component parts of shells, all of which have external or internal threads cut on some portion and the severe inspection and large quantities of above articles being made the cutting of threads has attained a high state of efficiency on screw machines and turret lathes that was unknown before the war.

An operator when given a good die should see that the two most essential things in setting up a screw machine or turret lathe are, first see that the die-holder or dies are in perfect alignment with the work, that the action of the turret slide is central or parallel with this alignment, also see that the die is square with the work, or to be more correct have the die parallel with the work.

It has been also demonstrated that the solid or shell type of dies will give more satisfactory results and threads cut to size better than by using the self-opening style of dies, owing to the slight taper which the latter cut on short lengths.

One of the best methods in testing out the alignment of a screw cutting die or hollow mill die in a screw cutting machine or turret lathe, to find out if it is central, is to give it the following test.

Run the die on to the piece until it fully engages on the threads then slip out the holder, is the easiest test for alignment.

However, if when the chuck revolves with the die on the end of the work it wobbles or runs eccentric something is radically wrong and imperfect threads will be cut.

If the operator is unable to get the die to run true a test arbor with a true thread should be cut in another machine, preferably a lathe. This is then gripped in a collet chuck and the die screwed on by hand; if the die then fails to run true it is a poor die which has been hobbed crooked, that is, when the hob entered the die it went in at an angle, or it sprung or warped in the hardening and tempering operation. By using a die in this condition the resultant thread will be tapered and in bad condition, and as the teeth in the opposite bands do not track, the thread wall will have a series of ridges and steps. Also, as the back edges instead of the cutting edges of the die lands are presented to the work the rubbing of same will tear the threads.

We all know that some new dies will not work satisfactorily at the start and the threads they cut will not pass inspection on munition parts and are quietly laid aside by the operator for fear he will use them. Others work fairly well and occasionally one is found

so good that the operator hides it out and runs it to the limit of production.

A great amount of this irregularity and trouble can be traced to the poor alignment of machines.

One of the best methods I employ or pursue on a die when it is new and not giving perfect results is to take a true threaded arbor and open up the die sufficiently to permit it to run on freely then allow the die to close when it will grip the arbor securely enough for grinding. Then in a cylindrical grinder I grind the outside and back of the die true to the arbor and if the die was sprung in hardening I grind the face of the die parallel with the back. If the die and holder are not central with one another the holder is defective, or the hole in turret itself is out of line or otherwise defective.

The majority of screw machines have liners between the lower turret slide and the base for vertical adjustment. If one of these machines are out of line a machinist can readily adjust it or re-align it but the operator should not touch it unless he thoroughly understands what he is doing and has the proper testing tools.

Floating holders help out considerably when the error is slight, the only objection being that they are frequently the cause of dies starting on crookedly and cutting a thread that is not true with the body of the work. A floating holder that is really an advantage on a screw machine is the telescopic type, which permits the die to travel on its work independent of the turret feed freeing it from the drag of the slide, and allowing it freedom to travel on its work and follow its own lead.

These telescopic holders often save considerable time in setting up and will take up defects in some cases but will not of course correct alignment. Screw machines and turret lathes as they come from the manufacturers, generally have good alignment, but they wear and should be frequently tested and realigned by scraping or shimming. This is not only important for good thread work but for other operations also.

Usually if the machines are kept in as good condition as when received from the manufacturers there will be no trouble caused by poor alignment.

However, always test out new dies to see if they have to be fixed at the start and if care is used the threads will compare favourably with threads cut in a lathe.

THE VISCOSITY OF OIL

By M. E.

One of the most used methods of expressing the viscosity of oil is in the terms of the Engler Scale. Degrees Engler means simply the ratio of the time it takes a given quantity of an oil to flow through a standard orifice as compared with the time it would take the same volume of water to flow through. Oil is usually sold, however, on the basis of its specific gravity (generally measured in degrees Baume) and its heat value and moisture content. It is usually assumed that the heavier an oil is in degrees Baume the more viscous it is, but that is not always strictly true. It is not to be regretted, that oil is not specified in terms of specific gravity instead of in degrees Baume, because in any calculations involving the weight of the oil per gallon or per barrel, it is necessary to refer back to specific gravity. Further, the heaviest oil that can be designated on the Baume scale for liquids lighter than water is 10 deg. B. or unit specific gravity. Oils are now being used of 10 and 12 deg. B., and, no doubt, still heavier oils will be used, which will call for two different Baume scales and cause confusion.

LARGE BALL BEARING CONTRACT

The Canadian S K F Co., 47 King street West, Toronto, has received an order for S K F ball bearing hangers for the new shop being erected by the Leaside Munitions Company at Leaside, North Toronto. This contract will cover over 400 ball bearing hangers, and constitutes the largest order for hangers ever placed in Canada. It is significant in the development of anti-friction bearings that they are being universally adopted in the largest plants for all drives, and indications point to their even wider adoption in the future owing to their great saving in power and increase in range of application. Conservation of energy is one of the outstanding problems of the day, and the use of ball bearings is one method of attaining this end.

In a plant of the size such as will be established at Leaside, when a large amount of money is involved, the efficiency of ball bearings must be positively proved and demonstrated because it is possible to purchase similar equipment of plain ring-oiled bearings at considerably less cost. The savings in power and lubrication etc. are very high for ball bearing, and warrant this extra expenditure.

The S K F bearings have been installed in several of the larger Canadian plants, including the Canadian Westinghouse Co., Duncan Lithographing Co., and the T. Eaton Co., all of Hamilton. Also the Consumers Cordage Co., Montreal, the Howard Smith Paper Co., Willards Ltd., and the Laura Secord Candy Works, Toronto, all these being complete installations, in addition to many others.

REGULATIONS FOR DEALERS IN COAL

Regulations regarding the importation, sale and delivery of coal have been issued by the Fuel Controller. Among other things they require that every coal dealer shall post in a prominent place in his office a conspicuous typewritten or printed notice containing a list of prevailing retail prices of all classes and sizes of coal handled by him, including discounts, if any. In calculating overhead charges to determine the price of coal, dealers are required to exercise moderation in the amount they include as their own salaries. In this connection the regulations state, "Salaries and expenses to officers or partners are not to be increased over those prevailing during the year 1914 at a greater rate than salaries in other lines have increased. A dealer may charge his business with his own salary but a reasonable rate only."

Dealers conducting a retail as well as a wholesale business are required to apportion their overhead expenses and fixed charges to each branch, and this apportionment must bear reasonable comparison with the average overhead expenses and fixed charges of dealers who are engaged entirely in retail or entirely in a wholesale business.

A VAST NEW OIL SOURCE

The oil shortage brings into prominence a hitherto neglected source of oil in the form of "oil shale," an organic-matter bearing clay formation, which, when crushed and treated with superheated steam, yields crude oil and sulphate of ammonia. The prospective development of the huge deposits of oil shale is one of the reasons for the oil land leasing bill now before Congress.

Shale occurs in widespread, thin beds which were formerly sea bottom. These beds are deposits of the clayey matter carried by rivers—clayey matter which, being finely broken up, does not sink readily to the bottom, but after being emptied into the ocean is carried by the current and spread over wide areas. One of the characteristic traits of shale formation is that it very readily breaks into thin layers.

Shale is oil yielding, but not oil bearing. Upon treatment with super-heated steam a chemical reaction takes place which yields crude oil. It must be mined like coal, and at about the same price, so that even with an extensive production of oil from shale there will be no great reduction in the price of oil.

Prof. Russell D. George, State geologist of Colorado, recently said that in two counties of Colorado there was enough shale to make "ten times as much oil as has been produced in the United States since the discovery of oil in 1859."

A new explosive is now being used in South African mines, and is resulting in a great saving of nitro-glycerine, says the "Board of Trade Journal." The shortage of the latter, owing to its use for ammunition, was indeed leading to difficulties in the industry. Hitherto the standard explosive used has been gelignite, which contains 57 per cent. of glycerine. It is now being almost entirely replaced by sengite, which is a gun-cotton explosive specially prepared and put into cartridges for the mines. The ingredients of sengite are more readily obtainable than nitroglycerine, and they are added to gun-cotton. Sengite is not altogether a new explosive but it is new to mining practice on the Rand.

DEVELOPMENTS IN SHOP EQUIPMENT

Makers of equipment and devices for use in machine shop and metal working plants should submit descriptions and illustrations to Editorial Department for review in this section.

RESILIOMETER

THE comparative measurement of resilience has always been a matter of some difficulty and in the purchase of such materials as felt, rubber and leather this property becomes of some importance.

The Widney Resiliometer made by the Advance Felt Specialty Co., Chicago, eliminates guesswork in the purchase of such materials and enables them to be purchased according to a rigid specification.

In many cases, the use of the resiliometer will show that material used hitherto for a certain purpose was improperly selected and indicate the proper material to be substituted; or that the specifications of the same material should be radically changed. Felt frequently supplants rubber and leather, simply because it retains its resiliency or "life" longer than any other similar material.

Tone felt, as used in piano making, can be purchased with absolute certainty, according to pre-determined specifications based on tests, thus eliminating one of the greatest uncertainties in piano construction and leading to more scientific methods in tone production.

The use of resilient materials, such as mechanical felt, rubber and various kinds of packings, has greatly increased during the past few years, largely due to the enormous development of the automobile and other engineering industries. It is generally recogized that some definite and comprehensive means for testing the specific properties of such materials is absolutely essential to the intelligent purchase and use of them.

In the case of all resilient materials, and particularly of textiles, the properties and specifications to be ascertained are the exact dimensions, relative hardness, relative resiliency and texture.

The instrument consists primarily of a dial underneath which is a presser foot touching a perfectly level base or platform on which rests the material to be tested. Making sure that the quadrant which holds the weight descending from it is drawn up and held by the spring-catch, the operator lifts up the presser-foot and inserts the material which is to be gauged and tested.

The large dial is graduated in 100 divisions, each of 1-1000 in., so that one revolution of the large pointer or hand is equivalent to an elevation of 1-10 in. of travel by the presser-foot. When the material is more than 1-10 in. thick the needle will revolve more than once around the dial. To count these revolutions a small dial is shown inside the face of the large one, with a pointer or hand that makes one revolution to every four complete revolutions of the larger pointer or hand. This is for convenience in reading.

Suppose the material to be tested is 1-10 in. or .100 in. thick. As the presser-foot goes down the hand may stop at the 100th graduation. This means that the thicknesces is 100-1000 in., which is the thickness of the piece of felt accurately given by the "Widney Standard."

The spring-catch holding the weight is now released and allows quadrant to swing back until pressure is put on up-

RESILIOMETER

per end of presser-foot at the top of dial. At once presser-foot sinks into material, diminishing its thickness, sending the pointer or hand of the dial backwards. When the presser-foot reaches the limit of compression the reading on the dial at that time is taken and compared with the normal or original reading. For instance:

Normal thickness reading . .100 in.
Reading under pressure . . . .050 in.

This means that goods of a normal thickness of .100 in., showing under pressure a thickness of .050 in., are 50-100 or 50 per cent. hard.

If it had not compressed at all, its hardness would have been 100 per cent. (an impossibility with any resilient material). If it had compressed to one-fourth its original thickness, its hardness would have been 25 per cent. If it had compressed to one-tenth of its original thickness, it would have been 10 per cent. hard, and so on.

This gives us the hardness figure of the material in question—a figure henceforth fixed and certain so long as conditions remain the same.

As soon as the above reading has been taken the quadrant is pulled back, releasing weight pressure on the presser-foot. The hand on the dial will begin to advance again. When weight is raised a sufficient height so that weight pressure is released from the presser-foot, the reading of the dial hand is noted. This reading should be taken immediately the weight pressure is released, thereby ascertaining the "instant" resiliency and not gradual return to normal of the material.

Now suppose that the dial-hand (which was at 50 under pressure) advances as pressure is released till it reached .080 in. the resiliency is 60 per cent. For

$80 - 50 = 30$ and 30 is 3-5 of $50 = 60\%$

In other words, the hardness figures showed a compression of .050 in. If the goods reacted to their original thickness they would be 100 per cent. resilient. The amount of reaction in proportion to the compression is the percentage of their resiliency.

Resiliency is sometimes confused with elasticity or "stretchability." Elasticity, as commonly understood, is the capacity of a given material to react after distention or deflection, fairly illustrated by the reaction of a rubber band after being stretched or distended beyond its normal position; or the reaction of a steel bar after having been bent.

Resiliency is one of the most important factors in felt, rubber, and analogous materials, which are bought and used for cushions, bumpers or other mechanical parts. The resiliency of a material is logically and correctly determined by its capacity to recover from compression.

The thicker the material the greater the resistance to penetration.

SAFETY SWITCH

In many steel mills, factories, mines and similar industries where most of the workmen have little knowledge of electricity, it is desirable to use switches having no live parts exposed or accessible in the ordinary operation of the switches or when replacing fuses.

This is fully accomplished in the Krantz Auto-Lock Switch, marketed by the Westinghouse Electric & Manufacturing Company, which is intended for use on main circuits or wherever an ordinary knife switch is applied. The switching parts and fuses are enclosed in a steel box, the cover of which is in two parts, one being screwed on to form a permanent covering for that end of the box containing the switch, and the other part being hinged so as to swing back and permit the renewal of fuses, which are located in this portion of the box. An ingenious latching mechanism makes it impossible to open the cover without first throwing the switch to the "off" position and rendering all fuses and other accessible parts dead. Thus fuses may be replaced at any time with absolute safety. As long as the door of the case is open the switch contacts can not be closed.

By using a padlock, the switch handle can be locked in the "off" position, making it impossible for any one to close the switch except the person holding the key to the padlock. By using another padlock the cover may be locked shut, so that the fuses cannot be tampered with. Either of these padlocks can be used independently of the other so that the switch cover can be locked shut with the switch either "on" or "off", or the switch can be locked in the "off" position with the cover either locked or open.

Contact is made by means of a laminated spring copper brush, double ended, with auxiliary arcing contacts at each end. The outer leaves of the brush are bronze to provide additional spring pressure.

The stationary contacts are of hand-drawn copper and are mounted on slate bases, one of which in the fused switch carries one of the fuse clips, while the other forms the terminal block for the incoming line and is mounted under the stationary portion of the cover.

The operating mechanism is galvanized steel of the toggle type, and is attached to the under side of the stationary end of the cover. This mechanism can be easily removed for inspection by removing several screws.

In closing, the pressure between the contacts causes the laminations of the brush to spread apart, giving it a wiping or self-cleaning action.

The double-ended brushes provide a double break, dividing the arc between the two ends, each of which is provided with a separate arcing tip.

In the closed position the switch is held in positive contact by throwing a toggle over the center. A spring provides a quick-break for opening, the mechanism being independent of the operating handle.

These switches are supplied for 250 500 and 600 volt, for either alternating or direct-current, service, and in capacities up to 2,000 amperes.

The safety features of this switch have been recognized by the American Museum of Safety, which has awarded it a gold medal and special mention.

SAFETY SWITCH BOX CLOSED, SWITCH OPEN.

SWITCH. SHOWING IMPOSSIBILITY OF TOUCHING LIVE PARTS.

INTERCHANGEABLE COUNTERBORES OR SPOT FACERS

Counterbores or spot facers are more commonly used at present than heretofore and practically all machine shops use counterbores or spot facers of some description. With this in view the Cleveland Milling Machine Co. have brought out a line of counterbores illustrated in the accompanying engraving.

The shank is made of high carbon steel and is heat treated. The taper is ground concentric with both the driving taper and the pilot hole. The cutter is made of high-speed steel and has a taper hole fitting the arbor and is driven by two face keys so that cutters of various diameters can be used. This construction of cutter makes it possible to easily grind the face of the counterbore true. The pilot is made of high carbon steel, heat treated and ground to fit the hole in the shank and cutter, and it is arranged so that any diameter pilot can be used with any diameter cutter within its range and the change made very quickly. The diameter of the pilot is ground .0015 smaller than the specified size.

INTERCHANGEABLE COUNTERBORE OR SPOT FACER.

FILING MACHINES

The filing machine illustrated herewith has been designed for efficiency, rigidity, and simplicity in construction and operation. A feature of this machine, made by the Newark Engineering and Refrigerating Co., Newark, N. J., is the square shaft which is supported by two extra long babbit bearings making side motion impossible, thereby eliminating the tendency to under cut when working to finished lines. An extra large working platen enables the machine to handle a great variety of work and adjusting and locking screws provide for adjustment of the angle at which the platen is set.

FILING MACHINE

COTTON CLOTH FOR AIRCRAFT

By M. M.

The cotton trade presents many war features. One of the most interesting —and one that is often overlooked—is the provision of cloth for use in the building of aircraft, more particularly of aeroplanes. In this direction the trade has afforded most valuable help to the Allies. In pre-war days the making of aeroplanes fabrics had secured a solid footing in Lancashire, and the government exercised a wise discretion, soon after hostilities began, in acquiring control of the whole output and preventing leakage to the enemy. But pre-war production was far from sufficient to meet war needs, and in the last two years there has been a considerable development in the making of fabrics that aeroplane building has asked for. More spindles and more looms have been set to work. Some of the best known and the biggest of the fine spinning concerns are wholly devoted to turning out the yarns, which are spun from high-grade Egyptian and from Sea Island cotton. To make this supply of cotton certain was one of the subjects which the government had in view in deciding to take over the whole of the next crop of Egyptian cotton, a step which had received unanimous approval of the trade.

In application of fine and strong textile to the covering of aeroplane wings cotton has been running a sort of race with linen. There is no doubt that the use of linen, in the past at any rate, has presented some advantages over the use of cotton cloth. Linen is stronger, and has a smoother surface. On the other hand it is heavier, usually weighing 4 oz. per yard as against 3¼ oz. in the case of cotton, an important consideration. One objection to cotton has been that the surface being less smooth than that of linen, there is some interference with the proper application of dope. As to the comparative strength of the two fabrics, one would suppose that cotton cloth, which will stand a strain of 1½ tons per square yard, would meet all demands that are ever likely to be made upon it. However there is no finality in sight in the design and manufacture of cotton fabrics. No one feels more strongly than manufacturers that we have not yet sounded the possibilities of cloth. The more the staple is examined and tested scientifically, the more wonderful does it appear, and the more clearly is it recognized, that the end is not yet. So far, the twin sciences of spinning and weaving in practice have kept fairly level with the demands of the public, but further progress will be made, and it is not too much to hope that cotton cloth will be produced which for aircraft purposes will be of unapproachable excellence and suitability.

At the present time experiments are being carried out with the object of eliminating faults and defects, such as they are, and of providing, a fabric which shall fully satisfy the needs of the aircraft industry. Designers of aeroplanes have laid down certain requirements and the cotton trade is endeavouring to meet them. It must be remarked in this connection that, as the aircraft industry has grown, its needs in the way of essential materials have grown with it and have become more exacting. The chief objects now aimed at are still greater strength and durability, and still greater powers of resistance to wind pressure, with an absolutely smooth and even surface that will not be too absorbent of dope. All this has to be accomplished without any sacrifice of lightness, and without any considerable reduction in the element of elasticity. We have every confidence that the response of the cotton trade will be of the most satisfactory character, and that the aeroplane cotton fabrics of the future will be worthy of a great industry which in the past has scored many triumphs.

MACHINE SHOP HEATING AND VENTILATING

By "Dale"

Considerable difficulty is experienced in arranging for the heating and ventilating of the single storey sheds with saw-tooth roofs now in universal favor for light machine shops. The wide expanse of surface exposed to the weather in such buildings makes the task of maintaining a comfortable working temperature difficult on cold days, and while roof ventilators and fans afford adequate ventilation in summer, they are invariably put out of action in winter on account of the excessive down draught of cold air, whereupon the air in the centre of the shops becomes stagnant and impure. But satisfactory hygienic conditions are essential to the maintenance of efficiency; hence some method must be devised to supply warm, fresh air in the winter, and cool air in the summer to all parts of the building. A good arrangement has been in work for two years past in a well known English plant at Birmingham. It consists of a number of cupola-shaped heaters (four in this particular case) distributed about the shed, each of which draws air by means of a 15-inch motor-driven horizontal propeller fan, located at the b down inlet pipe protruding through the roof, passes it through a battery of steam pipes, and ejects it at the floor level, whence it rises and circulates through the building. The down pipe is fitted, just below the roof, with a swinging damper which can be moved so as to block the admission of outside air and allow the warm air from inside the shop to be passed and repassed through the heater. This is very beneficial on cold mornings, as it enables the air to be raised to a suitable temperature in a short time, whereupon the damper can be moved back and the temperature maintained with the cold air outside passing through. This feature is a distinct improvement on many other types of heating apparatus. The steam is supplied to the heaters from a vertical boiler 9 ft. high by 3 ft. 9 in. diameter (which if worked at 80 lb. per sq. inch, is capable of serving eight heaters in the coldest weather) through 1 in. branches from the main steam pipe, and is trapped at the outlet with a steam trap of the float type, in order to prevent the passage of uncondensed steam. The condensed steam, after leaving the trap, is forced along a ¾ in. pipe, past a check valve, into the main return pipe, which conveys it to the boiler feed. The legs of the heater are utilized as a means of connection to the stem and drain pipes. Valves are fitted to both pipes of each heater, so that one can be out for repairs without disturbing the others. The temperature can be varied by altering the steam pressure, by varying the quantity of steam passing through the steam valves, or by means of the motor regulator, the latter being arranged to give four different speeds. During the warmer weather, when it becomes unnecessary to use the heating part of the apparatus, the fans are used for ventilating only. The impure air escapes through the interstices in the doors and between the valley gutters and the lower purlin on the glazed side of the roof. By reason of the pressure inside the building being slightly greater than that of the atmosphere, all leakages are from the inside outwards, and hence draughts are prevented. The cost of this method of heating and ventilating compares very favorably with any proprietary system, and at the same time meets all the requirements of a modern heating and ventilating plant.

It has been found possible mechanically to work tungsten containing a considerable amount of tungsten carbide when the carbide was made separately, powdered, and added to the tungsten powder before pressing. Tungsten ingots containing tungsten carbide made up in this manner may be mechanically worked when the carbon content is far in excess of that necessary to make the tungsten brittle ordinarily. When added in this way the tungsten carbide does not surround the tungsten grains.

In response to requests from the Ministry of Munitions and the Department of Scientific and Industrial Research, and in conjunction with the British Chemical Ware Manufacturers' Association and the British Laboratory Ware Association, arrangements have been made, with the aid of the Ministry of Munitions, for testing graduated glassware at the National Physical Laboratory on a larger scale than has hitherto been possible. The conditions of test, and scale of charges, are given in the test pamphlet of the Metrology (Glass Testing) Department, copies of which may be obtained on application to the Director, National Physical Laboratory, Teddington.

The Position of the Scrap Metal Trade

ONE of the changes that has come over at least one line of business as a result of war conditions has been the lifting of the scrap metal business out of the ordinary class, and placing it in the very extraordinary division.

Our first impression of the scrap business may have been gathered from the time when we used to spend Saturday afternoons out looking for old metal and bones, for which there was always a few cents recompense in any town or city in the country.

Very few outside of the trade know the tremendous amounts that are involved in the scrap transactions that are going on at present. And were it not for the fact that the Munitions Board steps in and takes over all the turnings and cuttings from the munitions shops now, there would be a volume of business in this line that would be hard to credit or believe.

The little old rickety wagon that wabbles around picking up the scrap iron is certainly coming into its own with a vengeance. It may be that in the near future we will see traffic cops giving it right of way over every other sort of vehicle in the congested area, and the gentry in charge of them wearing medals that will make iron crosses look flat, tame and uninteresting.

A decision that was made last week in a case that came up in one of the big steel and iron centres of the United States has a greater bearing than the simple giving of the decision. It was, in effect, that those working in scrap yards, sorting and handling second-hand metals, were engaged in useful occupations. There were a lot of people who had a habit of looking down on the man working in a scrap yard as following a poor game. There may have been nothing very romantic about the occupation, and it may have been from sheer necessity that the man entered the occupation. Well, allow for all that, but look at the standing of the business now. When other lines, that in ordinary times are apt to try for a top rail on the fence, and plume themselves as being very legitimate and useful businesses, are being closed down by the War Board as non-essential, the sanction of the same board is given to the men working in the scrap metal yards. Quite a change, isn't it?

The war is cutting a lot of new swaths that are hurting the feelings of not a few people. No man likes to have his organization dubbed by the authorities as non-essential. He has been in the habit of imagining that his little undertaking was the most essential concern in the country, and that if anything happened to it, panic, widespread an dterrific, would certainly come and camp in our midst.

But his concern has been passed by. The authorities have put the thing in the sieve of war need and it has gone through the meshes. The man at the head of it has been told that he can't enter the market for iron or steel, and he will have to close up until after the war or do something more necessary in his shop. There is bound to be a great old trail of punctured pride, hurt feelings and ruffled dignity in the land while a batch of these non-essentials sit down at the side of the road and watch the scrap metal cart go by in the procession approved by the Government.

Real Economy in Burning All the Coal

THERE seems to be no end of advice given officially and otherwise to the Canadian public this year in regard to the necessity of saving coal, both in power plants and in the heating plants for the home. Occasionally there are some suggestions in regard to the proper methods of firing, and the securing of perfect combustion that have some real value, but there is a great deal of wasted and misspent effort in the advice given as a general thing.

Real results are going to be secured in making it certain that the greatest possible amount of heat is secured from the fuel we burn.

A steam engine is a waster at best. It is considered quite satisfactory to use 20 per cent. of the actual steam value delivered to the ordinary engine, and in many cases the figure will be well below that.

Boiler efficiency is another matter that has much to do with the amount of coal burned and the relative amount of heat obtained from it. There are, of course, boiler plants where as high as 80 per cent. of the heat in the coal will be secured, but that is above the average. Perhaps a figure around 60 per cent. would be much nearer.

There should be an effort made to induce power plant users to go ahead and introduce in their premises appliances that will make it certain that they will secure the maximum amount of heat from every ton of coal that goes into their furnaces.

Very little is going to be gained by simply keeping up a harangue that the people should burn less coal. That will probably result in decreased efficiency all round.

The big drive should be to see to it that we burn coal instead of letting a large percentage of the combustible material drift up and out of the smokestack.

AN extraordinary story of a boy's enterprise was related at London Sessions, when Robert Scott (17), engineer, pleaded guilty to receiving stolen tools. Mr. St. John Hutchinson said accused was undoubtedly a lad of exceptional ability with a future before him. He left the Hugh Myddelton School when fourteen years of age, and entered prosecutor's employ, showing such engineering skill that at fifteen he was earning 35s. a week. While still that age he and another boy took a back room and commenced making screws and nuts. The partner, reaching eighteen, had to join the army, but Scott continued working, and was so successful that he was able to take premises at £130 a year and employ eleven men and eight women. He had saved £400 and spent it on machinery, and a further sum saved had been invested in war stock. He now held large contracts with the Government relating to aeroplane work. Sir R. Wallace, K.C., said that all must regret that the lad had used his marvellous gifts in such a way. He would give him another chance and bind him over to come up for judgment if called upon.—Birmingham Post.

* * *

AMERICAN officers in Canada are well pleased with the way Canadians are handling their orders. They started out to make this place the granary of the Empire, but they simply can't keep from sticking a machine shop in between the farms.

SPECIALIST IN FINE SCIENTIFIC TOOLS

From His Early Youth, Robert Dawson has Been Associated With the Manufacture of Accurate Recording Instruments

CHANCE, as a factor of industrial achievements, is rapidly being eliminated from the field of engineering, as the manufacture of fine scientific and mechanical instruments of the most modern type now assures a degree of accuracy never attained in the past. Until very recently work of this character had received little attention here in Canada, but early in the present year

ROBERT DAWSON

the engineering firm of Peacock Bros., Montreal, decided to open a new department for the repair and maintenance of the many recording instruments passing through their hands.

One of the essential considerations in connection with the efficient operation of such a department was that of securing a man suitably adapted, and with the necessary knowledge of such instruments, to carry on the work successfully. The firm, however, were fortunate in acquiring a man whose life has virtually been spent on a class of work that specially fits him for this previously neglected branch of Canadian industry.

Robert Dawson was born at Edinburgh, Scotland, of Scotch parents, but when two years old was brought to Canada, where his father secured a position with Messrs. Ross of Montreal, who in the past seventies were engaged in the manufacture of all classes of civil engineering instruments. When young Dawson was about seven years old the family returned to Scotland but shortly after migrated to Dublin, Ireland, where the father secured employment with the instrument firm of Yeates & Son. Subsequently, however, the senior Dawson started in business for himself, so that the early years of the "boy's" life were associated with the work that he eventually mastered. Much of his early training was acquired at the Dublin Technical School where the education proved of great assistance in his practical efforts.

After putting in several years of "spare time" with his father, Bob entered the services of Yeates & Son and gained a wider experience in the manufacture of all kinds of scientific instruments. After several years with this firm he engaged with Dobson & Curtis, remaining with them until they went out of business, afterwards entering the employ of Sir Howard Grubb at his astronomical works, Rathmines, Dublin. Sir Howard Grubb is famous all over the world as a manufacturer of large telescopes and other observatory equipment, and under his guidance Mr. Dawson helped to build instruments for Australia and South Africa.

Gains Further Experience

His next position was with the firm of Thos. Mason, Dane St., Dublin, where he had charge of the laboratory for testing and adjusting all kinds of measuring instruments, atmospheric recorders and all kinds of civil engineering instruments. While associated with this firm his work kept him in close touch with many of the large colleges of Ireland, notably Trinity College, the College of Science, all the colleges of Dublin, and many others throughout the country. In this position he also became expert in the moving picture business, Messrs. Mason having the largest connection in Ireland in the optical lantern moving picture machine trade. After acquiring considerable experience with this firm, Mr. Dawson opened a moving picture theatre of his own, but gave it up after a short period and came to Canada in 1913.

He Comes to Canada

His first position here was with the Gowland Optical Co., of Westmount, where for nearly five years he was engaged on fine machine work almost continually, the company manufacturing tools which were extremely accurate for grinding and polishing optical lenses. Upon learning that Peacock Bros., of Montreal, were contemplating the opening of a new department for the repairing of all kinds of scientific and recording instruments, Mr. Dawson made himself known to the firm and his past experience and general qualifications were such that he was engaged "on the spot" to take charge of the new department.

Prior to January of this year it was practically impossible to have repairs of this description made in Canada so that it was necessary to send the instruments to the States for overhauling and repairs, entailing not only an additional expenditure of money but long delay in getting equipment returned.

In addition to their regular engineering lines the impetus given to marine development has increased the scope of Peacock Bros.' activities and Mr. Dawson's duties have required his presence on many of the vessels plying in and out of the port of Montreal, for the purpose of repairing and adjusting many of the recording instruments used for navigation.

Mr. Dawson in his department specializes in the "Foxboro" type of recording instruments, he having made an extended visit to the works at Foxboro, Mass., to acquire the essential knowledge required for efficient service. Many other types of equipment reach him for repairs and are promptly turned out in working condition.

Mr. Dawson in commenting on the value of technical newspapers, says, "These papers are of vital importance to anyone working at a trade, as they enable one to keep in close touch with all the most recent developments and improvements in machines and equipment."

We never knew very many people who got into much trouble minding their own business.

* * *

IT'S an awful sensation for a man to go away for a couple of week's holidays and then come back and find that business has gone along splendidly during his absence.

* * *

SOME of the women who have been working in machine shops for the last couple of years, will, when they return to domestic life, be persisting in pouring oil on the bearings of the egg-beater, and adjusting to fine degrees the mechanism of the coffee grinder.

MARKET DEVELOPMENTS

Much Harder to go Into the U.S. Steel Market

Production of Steel is Gratifying, but it Cannot Keep Pace With the Demand For Plate—Scrap Dealers Classed as Being in the "Useful Occupation" Class by United States Courts

A finding recently handed down by one of the courts in Pittsburg gives an interesting sidelight on the tendency of war decisions, and the out-of-the-ordinary things that happen when they get down to deciding between essentials and non-essentials. The scrap metal industry is little understood in many centres. The scrap cart is not looked upon as having a very pronounced standing in the commercial category. But the U. S. courts have ruled that men employed in scrap yards are working at "useful occupations," and are given such recognition by the war authorities. And this is happening right at a time when a large number of industries that in peace time imagined they were very essential are being denied access to the steel and iron markets.

Some of the more recently placed contracts in Canada are getting well under way and production will be secured in a short time. The American officials in Canada are well pleased at the way in which the work is going on here, one of them being authority for the statement that the reports from this district reaching Washington were second to none in any part of the continent.

It is becoming harder to secure steel in any shape from the American mills. There is a tremendous demand there for plate for the Emergency Fleet, and the figures advanced seem to increase every time there is a fresh announcement made of the requirements of the situation. Nor does it seem to make much difference who is the seeking party in Canada. For instance the firm contracting for the boilers to heat the Parliament Buildings at Ottawa have been held up for a good many weeks on account of their inability to secure boiler plate. An attempt is now being made by a Cabinet Minister to have this plate included in the Canadian allotment for the month and released immediately.

There is still a large volume of business being done in machine tools and supplies. Some of the firms here are having a little difficulty in tooling up for new contracts, not being able to get deliveries on all the material they require. The demand for high speed steel is very active again, and some lines are not securing as rapid deliveries as might be desired.

Production figures from the large producing centres in United States show that figures have kept up remarkably well during the hot weather. There is always a falling off during the excessively hot period, but this tendency has been less marked this year than formerly. No doubt the urgency of the situation has had much to do with the way in which the men in furnace and rolling work have kept production up to a high standard.

Many of the mills report a good supply of heavy melting steel in the yards and on the way. In fact, some of them are so well supplied just now that they are not taking on further supplies. There is still a scarcity of good machinery scrap, and some of this would be very acceptable in a good many foundries just now.

EXTREME HEAT OF WEEK AFFECTS OPERATION AND PRODUCTION

Special to CANADIAN MACHINERY.

MONTREAL, Que., Aug. 13.—Activities in almost every industry have been more or less affected by the exceptional hot wave that has been prolonged during the past week. Production in many lines has fallen off and in some instances sections of plants have been been forced to operate on shorter time to relieve the men from the extreme heat. Another feature that has a bearing on the general conditions is the holiday season that invariably affects business. Inability to secure materials has tended to disorganize business, but under the circumstances operations are proceeding with reasonable regularity.

Steel Still Acute

Tension in the steel situation is still very pronounced and no relief has been shown in the obtaining of material from the mills. Nothing but oessential requirements will receive cnsideration from the War Trade Board and therefore domestic trading has been virtually eliminated. Manufacturers here are still seriously handicapped for lack of sufficient steel for capacity operations, and this condition is more pronounced in the shipbuilding industry than in any other, plates being the material that is the hardest to obtain. As may be expected the extreme warm weather has been and will continue to be a detrimental factor to production, as workmen are frequently unable to keep the pace that is possible in cooler weather. The situation here maintains its acute condition, and dealers do not anticipate an early change for the better. With few exceptions the market is held very firm and prices are unchanged.

Good Demand for High Speed Steel

As a result of the recent activity in the manufacture of munitions the requirements for high speed steel have been on a scale equal almost to that of a couple of years ago. Difficulty is still experienced by dealers here in obtaining supplies of steel from the makers, especially where the source of supply is in England. One dealer reports that delivery from Sheffield cannot be assure under a period of from 6 to 9 months. Sizes that are in heavy demand can virtually be disposed of on the very day of their arrival. Consumers show some reluctance to purchasing sizes larger than they need, as in many instances the surplus must be wasted,

and at $2.25 per lb. this is very often a serious factor.

Metals Generally Quiet.

Apart from the nervousness that still prevails in the tin situation the metal market has developed no features of special interest. Copper has steadied following the assurance that the existing price will prevail until November the 1st. Tin attained a record high during the past week, but is again at the level of the past several weeks. The other metals are comparatively quiet and price quotations are unchanged.

COPPER—The situation has taken on a steadier tendency owing to the announcement that the newly revised price will be extended to Novmber the 1st. Metal is still hard to obtain owing to the abnormal requirements both here and in the States. Prices here are very firm at 31 and 32 cents per lb.

TIN—The market is still in a very acute stage, this having been additionally emphasized by the recent advance to uprecedented price on the Singapore market. This peak quotation, however, has since declined and the situation is again back to its previous position of uncertainty and nervousness.

Dealers here are still having difficulty in securing metal, but are able to supply the most essential needs of their customers. Local quotations are very strong at $1.25 per lb.

Holiday Season Affects Tool Business

In common with all general business the machine tool activity has been passing through a quiet period as a result of the warm weather and the absence of the officials responsible for the placing of orders for tools and equipment. The decline in the enquiry for new machinery for shell making would appear to indicate that the bulk of the tools required for this purpose have already bbeen ordered. Many of these tools, however, are still waiting to be delivered but the pressure on the machine bulider is at present so great that definite date of shipment is very uncertain. This condition is not conducive to maximum steel production and where used equipment can be found available the same is often temporarily acquired to assist production. The general demand for machine shop supplies continues very good but frequently the same condition of uncertain delivery applies to this as to the heavier tools.

Scrap Very Quiet.

The scrap situation has been somewhat affected by the warm weather and the holiday season and general trade is very quiet. Dealers report little doing, the bulk of the business being of a local character, small lots of odd material coming in from the country. The present demand is far from encouraging, but dealers here anticipate a renewal of activity within a few weeks. Dealers here are rather reluctant to stock up when the demand is so light as consumers are only buying to cover their immediate requirements. A few changes have taken place in the week's quotations, notably in copper and brass. Copper is now ranging from 21 cents for light to $25.50 for crucible and heavy. Light brass is now quoted at 10 cents, being a little easier than last week. An advance of $2 on stove plate puts the current price at $26.00 per ton.

POINTS IN WEEK'S MARKETING NOTES

Inability to get boiler plates from U. S. points has held up boiler work for the Ottawa Parliament Buildings. One of the Dominion Ministers is trying to get the amount included in the Canadian allotment.

—

The price of plate is practically fixed at $10 for Canadian points. Before the war sales were made at $2 50, and dealers claim they made more money at that sale price.

—

Canadian authorities now recognize $7.50 f.o.b. mill as the selling price for steel plate.

—

A finding in U. S. courts places workers in scrap yards in the category of those who are following a useful occupation.

—

Machinery scrap is much in demand, but reports have it that some of the mills are well filled up with heavy melting steel—so much so that no new purchases are being made.

—

American officials attached to the Imperial Munitions Board here are well pleased with the production records they are securing here.

—

U. S. experts are not certain whether it would be good policy on their part to try to build new blast and open hearth furnaces. At present all war activity practically rests on the ingot production.

—

The shipments of Lake Superior iron ore that are passing down this year are breaking by a large margin all previous records.

—

Reports for the past few months show that United States railroads are getting a much higher car-mile rate than formerly.

—

Pittsburgh reports that the decrease in the hot weather is much less marked this year than is usually the case.

CAN'T GET PLATE TO MAKE THE BOILERS

And So Work on Canadian Government Contract Has Been Held Up For Some Time

TORONTO.—Some nice orders are being handled by machine tool houses in Toronto—orders that run into a good many thousand dollars. Of course the great bulk of it centres around the war contracts. Some of them are not altogether in the category of war business, from the standpoint of munitions. For instance, Fairbanks-Morse have just completed the placing of a good sized order for the Aviation Department of the Imperial Munitions Board. This is for the fitting up of an engine repair park for the flying camps in this district.

Dealers are getting better deliveries from many of the shops where they had placed contracts, especially for single purpose machinery, and on this account deliveries of shells will be hastened to that extent. One of the officers in the American section of the Imperial Munitions Board expressed himself as well pleased with the work of the Canadian war contract shops. Discussing the matter with a representative of CANADIAN MACHINERY the officer in question intimated that the reports that were sent to Washington regarding output and progress were not outdone by any report reaching the American capital from the various branches in the republic. He stated that the work here was being well done, and that they were receiving every assistance from the officers of the Imperial Munitions Board.

The steel situation does not improve. It is becoming a harder matter to secure material from the States, and the fact that a person gets a license does not mean that the goods will be delivered. In fact this shortage of material is causing the holding up of a good many enterprises in this district that would run into the thousands and millions.

Can't Get Supplies

The big contractor is suffering with the little fellow. For instance the firm that is making the boilers for the new Canadian Parliament Buildings at Ottawa has been held up now for almost two months because the plate cannot be secured from the rollers to permit the firm to go ahead with the work. As the season is getting well advanced some of the authorities are anxious to get progress with the work, and one of the Canadian cabinet ministers has taken the matter up in an effort to have the Ottawa order included in the Canadian allotment. As one of the Toronto dealers put the case to-day: "Our experience is that it is not much of a trick to get a license and a priority certificate. Once a person is armed with all that paper he imagines when he approaches the rollers that it will be simply a case of going in and looking over the stock and filling your order from it. But you find that your man at the mill is not very much impressed with all your docu-

ments. He tells you that he will place the order on his books, and he will also tell you that there are a whole lot of people in possession of just the same sort of official documents that you counted on to move all obstacles out of the way for you. Our experience is that priority orders and licenses are not nearly as formidable and as powerful as one might think."

Some Tubes Coming In

One Toronto firm got in a good sized shipment by lake of boiler tubes. They were of the seamless variety, and there seems to be more of these on the move than of the lapweld. There has been a decided shortage of the two-inch size, but apparently there has been some relief in the supply of skelp, which has been blamed for some time past for holding up the finished tube.

As intimated in these columns of last week, prices on galvanized sheets have advanced 50 cents per hundred, and there has been an increase in the black sheets, but hardly to the same extent.

Plate Price Agreed On

The price quoted for plate for some time past has been around the $10 mark, and it seems likely that this will continue as the basis of trading for some time to come. Although no announcement has been made, it is generally understood that the Government and the jobbers have come to regard the $10 per hundred price as a fair point for the selling of plate. A few sales are made slightly under that point, but not many. The Government has sanctioned an f.o.b. price of $7.50 at Canadian mills and another cent can very well be added before the material is placed in warehouses here.

It is interesting to recall, in view of the $10 price that it is not very many years ago since plate was quoted at Pittsburgh around the $1.05 mark. Sales were made from Toronto warehouses right along around $2.50, just one-quarter of the present price.

Recognizing Scrap Workers

An incident in the Pittsburgh district recently has an interesting bearing on the scrap metal situation. The War Industries Board has given recognition to those working in scrap yards that they are engaged in work that comes under the heading of "useful" and approved of by the war authorities of the republic. This is done at a time when supplies are gradually being denied to many concerns that in times of peace would be inclined to look askance at the scrap metal dealers.

There is not a very great amount of trade passing in the scrap yards. Dealers here state that the mills are well filled up with heavy melting stetel, and they are to a large extent rather at a loss to know where it is coming from. One of the dealers stated this morning that a rolling mill had almost 800 cars of scrap in the yards and on the way, and were refusing to take on anything else, claiming it was not graded up to their requirements. There is still a shortage of good machinery scrap, and any of the yards here would be glad to take on a lot of business in this direction. Prices are tight just now, and those in the trade state that it is not possible to get a cent over the market price.

Still All War Business

The dealers here are still handling big orders. Most of them can be traced directly to war business. There is nothing in this to indicate that other lines have gone out of action, but it is the result of war pressure, and the unsatisfied demand for supplies. Some of the shops in Toronto that are handling the 9.2 orders have started work on the first one or two operations, but little progress has been made as they do not wish to fill up their shops. The desire is to get a steady flow through all operations at the same time. There is delay in some quarters on account of not being able to secure tools on the time notice given. High speed goods are still in big demand with prices unchanged.

COMBING COUNTRY FOR SCRAP BRINGS ONLY SMALL AMOUNT IN

THE importance being assumed by the scrap metal situation at the present time would almost warrant some better name being coined for this trade. Certain it is, that never before in many years has there been such a diligent search for the elusive second-hand metal as is going on all over the country at the present time. Foundries, finding themselves short of pig iron, are making that shortage up in many cases by introducing a much larger percentage of scrap than is usually the case. Open hearth furnaces are also on the market all the time for scrap. Reports from U. S. points are as follows:

Pittsburgh.—This great steel centre, it is estimated, consumes about 44 per cent. of the entire scrap output of the country and against this there is produced here only about 24 per cent. of the amount, so that even under ordinary conditions it has to depend upon outside sources for a good 20 per cent. of its supply. The trouble here just now is that these outside sources cannot be drawn upon as they are making use of all their own scrap. Although shell steel turnings are being made in greater quantity than ever before, it must be remembered that they aore also being consumed as fast as they are produced.

Boston—The labor situation has not improved at all in this district and it is very safe to say that the labor shortage is making it impossible for the yards to handle one-half of the business that could be carried by them.

New York—A continuous and persistent demand has forced up the prices on stove plates and grates to the maximum limits of the market. The intensely hot weather of the past few days has had a telling effect on the volume of business carried and a number of the yards have been curtailing operations to a considerable degree.

Philadelphia.—A ruling that has been made by Provost General Crowder regarding employees of scrap yards wiill have considerable interest all over the country. The point was raised as to whether employees of these places would be considered as working at essential or non-essential occupations and the ruling of the authority in this case is that those working in scrap yards are carrying on business that is regarded as being essential and is placed in the class of useful work. There is a very keen demand here for all grades of scrap and this tends to keep supplies scarce and also to limit the number of sales.

Buffalo—Many of the consumers here are handicapped by a great shortage of labor and a number of the dealers are in even worse shape. As a matter of fact there is not a very great deal of scrap in the dealers' yards, as the most of it moves out almost as quickly as it arrives.

Cleveland—A number of the dealers here are wondering what will happen on October 1st, for on that date it is anticipated that the scrap and steel prices will be revised again for the next three months.

Youngstown—A very large number of the dealers here are short at the present time and are fearing that an increase in prices will come, as they are hearing constant complaints from the producers that the present prices being paid are too small for them to do business on. A man who has scrap to sell here at the present time can very easily find buyers, but the buyers in a great many cases find it very hard to find the sellers.

Chicago—The usual sources of scrap here are not yielding as much material as formerly and the railroads are doing comparatively little to help on the situation. In nearly every line prices are advancing gradually and nearly all of the items will be at the Government maximum shortly.

Cincinnati—There are two things that stand out prominently in the market situation here right now—one is the increased demand and the other is the decreased supplies of scrap. The dealers are not making predictions as to what the outcome of this situation may be.

St. Louis—Dealers here are making every effort to secure increased tonnages but they are rewarded with only indifferent success. Very little of the railroad scrap ever reaches the yards now as there seems to be a disposition on the part of the officials to deal direct with the consumers.

Clutches.—Hill Clutch Co., Cleveland. June issue of "Hill Clutch Equipment." Mentions an installation of clutches and bearings at the Baker R. & L. Co. for the testing of automobile engines. A description of the equipment employed is presented, supplemented by two illustrations of the engine testing section and others of the bearings and clutches used.

HABIT OF "TAKING HOLIDAYS" INTERFERES WITH PRODUCTION

Special to CANADIAN MACHINERY.

SYDNEY, N.S., August 14.—The contract for the excavation and foundations of the new plate mill at the Dominion Steel Company's Sydney plant has been let to the Bate-MacMahon Co. and work on this contract was commenced on the 7th August, which is stated to coincide curiously with the date when the first sod was turned for the plant itself, namely 7th August, 1899, or nineteen years ago exactly.

The plate mill itself is being furnished by the United Engineering Company of Pittsburgh. The Dominion Bridge Co. is furnishing the structural material for the mill buildings.

While no exact date can be given in connection with construction work under present day conditions, it is thought that the plate mill may be in actual operation before Christmas, 1919.

Taking "Holidays"

The employees of the Dominion Steel Company have on two successive Sundays taken a "holiday" as a protest against the non-granting of their wage demands in full. In May, a Royal Commission considered this matter and made certain recommendations which the Steel Company fulfilled to the letter, and in addition gave further substantial increases to classes which had not been included in the recommendations of the Royal Commission. Still further increases have been promised, but nevertheless the employees have taken the extraordinary course mentioned. A "holiday" on Sunday is just as injurious to a continuous process operation as a holiday on any other day, and as a result the production of the plant has been interrupted in each instance for half the week following the "holiday." The proceeding is a profitless and inept one on the part of the workmen, for it reduces their earnings, both as to day rates and as to tonnage earnings, and of course, it has the still more important consequence in these days of reducing the production of munitions steel. The idea of taking this "holiday" on a Sunday is a subterfuge, and not a particularly subtle one at that.

Pro and Con Argument

A certain number of the workmen object on conscientious grounds to working on Sundays, but as was proved very clearly before the Royal Commission, a still greater number prefer to work on Sundays, and indeed to get in as much overtime as possible. The real desire of the workmen is to be paid time and a half or double time for Sunday labor, which, in a continuous process, merely amounts to a demand for a general increase in wages. The long week-end shift which is called for every alternate week in the case of twelve-hour men is objectionable, but the alternative is a serious one. It is nothing more than the adoption of a three-shift system covering the 24 hours in lieu of a two-shift system. Short of this change in system, there is no possible means of avoiding Sunday work, or the long week-end shift every fortnight. Some day this revolutionary change may come about in steel works, but the present time of labor shortage and extraordinary demand is not the best moment to choose for enforcing such a change.

The Attitude of Ottawa

The attitude of the Labor Department at Ottawa has recently been to put most of the onus for labor disputes upon the employer, it being apparently the idea at Ottawa that nothing is easier than to raise wages and shorten hours because trade conditions are so prosperous, but here is an instance where the employers have far exceeded the recommendations of a judicial body appointed by the Government to investigate and recommend an equitable settlement, and while recalcitrance on the part of the employer would doubtless have been quickly dealt with by Ottawa, when the fault lies with the workmen, the Government is apparently unable to take any effective action.

According to the agreement between the Amalgamated Mine Workers and the coal operators in the Sydney district, an advance in wages becomes effective 1st July, calculated on the increase in the costs of living which are supposed to have taken place between the 1st of January and the 1st of July. There is some difference of opinion as to the true amount of this increase, but there will be no difficulty in arriving at a settlement. The company has offered an increase of 20 cents per day to all workmen, plus certain bonuses to the men at the coal face, and it is likely the offer will become the basis of the settlement.

FORD TO DOUBLE HIS TRACTOR OUTPUT

Many Big U. S. Plants Hasten to Turn Over to Making War Materials

Special to CANADIAN MACHINERY.

NEW YORK, Aug. 14th.—War work is absorbing manufacturing capacity of the country to a greater extent than ever before. In the last ten days, several important industries that heretofore have kept within the limits of their ordinary work, have turned with avidity to the manufacture of shells, airplane motors and other munitions which go directly to the army and navy. The Government has distributed several large orders for trench mortar shells, illuminating projectiles, gun parts, mechanisms and airplane motors.

Cars to Plane Motors

The Pierce-Arrow Motor Car Co. has come into the market for several hundred machine tools which will be used in converting its Buffalo plant, previously used in the manufacture of pleasure cars, into a factory for the production of airplane motors on a large scale. It is planned eventually to manufacture fifty Hispano-Suiza airplane motors a day. It is hoped by January 1st to turn out thirty motors a day.

The U. S. Cast Iron Pipe & Foundry Co., which has found much difficulty recently in obtaining enough pig iron to keep its plants operating 50 per cent. of capacity, has turned to war work, having accepted a large contract from the Government for 6-inch cast iron and steel shells upon which some external machine work will be necessary. The orders will be executed at the Burlington, N.J., and at the Alabama shops at Birmingham and Bessemer.

The Laclede Gas Light Co. of St. Louis, has accepted a large contract for projectiles and is equipping a factory which will duplicate that now being constructed by the Scullin Steel Co. Each of these plants will have a capacity to produce 300,000 150 mm. and 240 mm. shells a month.

The Savage Arms Corporation, Sharon, Pa., is buying additional shop equipment to increase output of guns and is now making extensions to its Isaac Sheppard & Sons plant at Philadelphia and at its Defiance Manufacturing Works at Somerdale. The Midvale Steel & Ordnance Co. has finally awarded its large contract for cranes for the Nicetown plant, equally between the Morgan Engineering Co. and the Alliance Machine Co. of Alliance, Ohio.

The Bureau of Supplies and Accounts, Navy Department, has put out a list of sixty-four machines which are to be purchased and installed in the Washington Navy Yard. Specifications cover 24 drill presses, fifteen milling machines and nine boring machines. The quartermaster's department of the army is still in the market for twelve semi-portable bridge cranes which are to be established in the mammoth stores now being constructed at Boston.

Railroads and railroad equipment manufacturers are making some purchases of shop equipment for the building and repairing of motive power. The Lima Locomotive Works, Lima, Ohio, is enlarging its plant to give it capacity to produce fifty instead of thirty locomotives a month. The Norfolk & Western R. R. has asked for bids on forty machine tools and the Nickel Plate has begun to purchase against the revised list of tools which it originally put out last February.

Shipbuilders continue actively in the market. The Federal Shipbuilding Corporation has bought a large amount of hydraulic machinery in Philadelphia and also ordered several additional cranes for its Kearney, N.J., shipyard. The Downey Shipbuilding Corporation has bought sixteen machines to be installed in its machine shop at States Island. The Sun Shipbuilding Co., Chester, has bought more cranes and machine tools. The New York Shipbuilding Corporation has also made additional purchases of fabricating machinery. Henry Ford & Son are preparing to enlarge their plant in Dearborn, Michigan, in order to produce 150 tractors a day. The Wisconsin Gun Co. has purchased machinery which will double its capacity.

FURNACES ARE NOT TURNING OUT ENOUGH PIG TO SATISFY MARKET

A SURVEY of the situation in the United States at the present time makes it increasingly certain that those industries there that are working on war contracts are receiving a very decided preference. In fact it amounts to this, if an industry is not working on essential work, the chances of it receiving sufficient supplies to keep in operation are very poor indeed. A review of the conditions existing at present in the pig iron centres of United States gives the following information:

Chicago—One deal that was sanctioned by the Government here this week makes it apparent that for the first time in some days manufacturers of railway equipment are going to receive some consideration at the hands of the Government. In the case referred to an allotment of 7,500 tons of basic iron was made to a leading independent steel maker to be worked up into railway equipment.

Boston—Manufacturers of stoves in this district are making a strenuous fight to see if they cannot have greater supplies released to them and some of them are using rather ingenious methods to secure these. For instance, the oil stove manufacturers are arguing that their products in causing the non-use of coal are serving a double purpose in conservation—crude and fuel. Indications are, however, that they will hardly get past with his claim, and they are not likely to receive any more iron than they have been doing in the past. In accordance with the desires of the Government, no iron is being sold for 1919 delivery.

New York—It would not be a very hard matter for any person to book a large amount of 1919 business here, but the Government has requested that this policy should not be followed and for that reason 1919 business is not being booked at the present time here.

Philadelphia—The intense humidity of the past few days has been considerably affecting furnace operations in this district. In a few cases, Eastern furnaces are booking occasional orders from regular customers for iron for first half of 1919 delivery, but these cases are very much the exception rather than the rule.

Pittsburgh—The trend of war trade and industry can be noticed here in a great many ways, one of them being the increasing number of consumers of pig iron that are shifting from non-essential to essential production. This has made it necessary to some extent to revise the lists already made out by the Government in connection with these industries. The War Board discourages the idea of uses of pig iron except in contracts without first having assurance that they will be able to obtain their raw material. Furnace operations are unusually heavy, but it seems unlikely that production will be large enough to meet all the essential demands.

Youngstown, Ohio—The situation in regard to pig iron in this district can very accurately be described as a serious one at the present moment. Producers of pig iron declare that they cannot see their way clear for months to come and are very much alarmed over conditions.

Buffalo—Any concern in this district that is producing any pig iron seems to be quite satisfied at the present time to allow the Government to take over the functions formerly discharged by its sales staff. They seem to be quite confident that Washington will be able to take care of the production of all their furnaces.

St. Louis—Inquiries here bring out the information that foundry iron for non-war usage is rapidly shrinking to very small dimensions. Shops that a month or six weeks ago were hoping to be able to continue operations are now taking a very pessimistic view. It is estimated that with what they have now on hand and what is on the road and by the generous introduction of scrap, a number of plants will be able to operate until the end of October, but it is almost certain that from that time on there will be a continued falling off of the operations.

HOT WEATHER BROUGHT SMALLER DECREASE THAN USUAL IN PRODUCTION

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., Aug. 15.—A thorough canvass has been in progress as to the feasibility and desirability of increasing the output of steel by new construction. Not only the sanction, but also the hearty co-operation of the War Industries Board would be requisite before anything could be undertaken. A large amount of labor would be required, also a great deal of material, and much transportation would be involved and the matter would have to be considered from all angles. While the steel industry is fully able to finance its new construction itself, when it is new construction dictated by prospects of making money, the new construction that would be requisite at this time would not have such a future before it. After the war the industry would be left in an unbalanced condition. Indeed, it is only because the industry is quite out of a state of balance by reason of the peculiar nature of the war demand that it becomes feasible to increase the output of finished material by a relatively small volume of new construction. Study has shown that many of the finishing branches of the steel industry are quite insufficiently supplied with raw steel in the form of ingots, blooms and billets because such a large amount of raw steel is withdrawn from the situation by the demand for shell steel and the extra demand for plates. By the erection of a large number of open-hearth steel furnaces and a number of blast furnaces the production of finished steel would be greatly increased. The finishing capacity is already available, being indeed idle at present in considerable part, while there is also in prospect sufficient coke and sufficient Lake Superior iron ore to take care of many additional blast furnaces. If men, materials and transportation facilities were withdrawn from other activities to a sufficient extent the new capacity might be completed in the course of about six months, the question being whether it would be enterprising to make such withdrawals.

Plenty Lake Ore

Shipments of Lake Superior iron ore down the lakes in July totalled 10,659,203 gross tons, the record for any month in history, and bringing the season total to August 1 up to 29,608,933 tons, which presages a total movement for the season of about 65,000,000 tons. This is 10,000,000 tons above the inside estimate made before the opening of navigation. At that time the railroads had only partially recovered from the great blockade of the winter, and the entire matter of moving ore for the coming season hinged upon the railroads. All the plans provided that the convenience of the railroads should be served, the boats only moving so fast as the railroads could serve them. Since then the railroads have gotten into excellent shape and there is no difficulty at all about moving ore.

Heavy Freight Movement

As an evidence of the railroad situation, the latest statistics are for April and they show that even in that month the railroads moved freight at the rate of about 448,000,000,000 ton-miles a year. Prior to 1916 the best fiscal year total was 301,398,752,108 ton-miles, in the fiscal year ended June 30, 1913. The best posted shippers in Pittsburgh always contended, when the railroads were so badly blockaded last winter, that what they needed was system and locomotives. Government control has given them system and the locomotive shops have furnished many locomotives. Shippers did not feel that the railroads needed cars at all badly, for indeed one trouble was that the existing cars were blocking the tracks. Since April, which showed the freight movement just noted, there has been a further and great improvement in the railroad situation.

Steel for Jobbers

The pipe and wire mills find they can do fairly well in carrying out the War Industries Board's program as to shipments to jobbers during August, it being permissible to ship as much steel in August, as the monthly average shipped during the first half of the year In sheets and merchant bars it will be difficult to ship more than a fraction of the tonnage permitted. Some of the pipe mills had already received specifications from their jobbers during the first week in Auust. The American Steel & Wire Company issued a circular to its

ENGINEERING

Montreal, Que.—The Imperial Tobacco Co. is building an extension to its power house.

Montreal, Que.—Lamontagne Ltd., are building a factory and power house to cost $55,000.

Amherst, N.S.—The International Engineering Works will build an extension to its factory.

Sudbury, Ont.—A new boiler house will be built at St. Joseph's Hospital. H. D. Evans has the contract.

Tillsonburg, Ont.—The Tillsonburg waterworks tower has been destroyed by fire. Loss estimated at $50,000.

Toronto, Ont.—The J. Whitefield Co. will build an addition to the plant at 33 Sherbourne street, to cost $6,000.

Toronto, Ont.—The Lancashire Dynamo & Motor Co. will build an addition to its machine shop to cost $3,000.

Toronto, Ont.—W. H. Banfield & Sons have been given a permit to build a new machine shop at 372 Pape ave. to cost $10,000.

Guelph, Ont.—The installation of a pumping machine, $16,000, is contemplated by the City Water Commissioners. Engineer, F. McArthur.

Prince Rupert, B.C.—The Prince Rupert Hydro-Electric Co. contemplate the erection of a waterpower plant. City engineer, P. Lorenzen.

Levis, Que.—Plans are being prepared for a $100,000 filtration plant for the City Council. Engineer, Edouard Hamel, St. Peter street, Quebec.

Toronto, Ont.—The Cluff Ammunition Co. has been granted a permit to build a pent house at its factory at 28 Atlantic avenue, to cost $2,000.

Montreal, Que.—An extension will be built to the British Munitions Co.'s plant at Verdun at a cost of $30,000. E. G. M. Cape & Co., of Montreal have the contract.

Lauzon, Que.—The construction of waterworks costing $10,000 for the Town Council is under contemplation. Engineer, E. Hamel, 21 St. Peter street, Quebec.

Montreal, Que.—Williams and Wilson, Ltd., 320 St. James street, are erecting a $125,000 factory and office building. Architects. T. Pringle and Sons, Coristine Building.

Quebec.—A new concern know as the Eastern Machinery Co. will establish a factory here for building machinery. Amable Laprise of this city is interested in the new company.

Chippewa, Ont.—A by-law will be voted on by the ratepayers on August 20 to sanction an expenditure of $6,500 for the purpose of installing an electric light plant in the village of Chippewa.

Woodville, Ont.—A by-law will be voted on by the ratepayers on August 19 to raise $1,500 to provide for the cost of completing plant for the distribution of hydro-electric power.

Rainy River, Ont.—A by-law was submitted to the ratepayers on August 12 to authorize an expenditure of $31,000 to purchase the plant and equipment of the Rainy River Electric Light & Power Co.

Toronto, Ont.—City Architect Pearse has issued to Canadian Aeroplanes, Ltd., permits to erect an additional storey to the north end of their metal building, an addition to the wing and dope building, and a one-storey addition to the fusilage building, all on Dufferin street, at a total cost of $114,000.

Port Colborne, Ont.—The International Nickel Co. of Canada began to treat matte at the new refinery at Port Colborne recently. A large quantity of matte from the Copper Cliff smelter has been shipped to the refinery, and supplies of all kinds are now on hand, and one furnace is in operation.

St. Catharines, Ont.—A serious fire broke out at the Canadian Warren Axe and Tool Co.'s plant shortly after 1 o'clock on Monday afternoon, and before it was got under control had destroyed the large forging shop, onthing being left but the brick walls. The loss will be about $25,000, largely covered by insurance. The fire was caused by an explosion in an oil feeder, and quickly spread to the entire building. The other buildings of the plant were saved from damage.

GENERAL

Toronto.—E. Kelvington will build a one storey showroom and workship on St. Clair avenue, to cost $2,500.

Toronto.—The Martin Corrugated Paper Box Co., will build a concrete tank at a cost of $2,000.

Russell, Man.—The Manitoba Telephone Commission are building a new telephone exchange in Russell, and tenders are being called for the erection.

Cobalt, Ont.—With the intention of prospecting in the bogs of New Ontario, giving special attention to those in the vicinity of Cochrane, A. Anrey, a Dominion Government specialist on peat, arrived in town recently en route to the north.

Brantford, Ont.—Fire caused damage to the amount of $10,000 in the new Waddell Preserving Company's plant here on August 7, on Clarence street. The fire was discovered at 8 o'clock in the centre of the main building, and before the firemen arrived the whole building, containing much lumber, was enveloped. The blaze was confined to the centre of the building, where considerable stock was destroyed.

Calgary, Alta.—The Dominion government is about to undertake the work of testing the gases of all the Alberta fields with a view to ascertaining the gasoline contents in each. The work will commence in the Calgary field under the supervision of D. R. Dawling, of the Canada Geological branch.

Windsor, Ont.—The City Council has formally approved the sale to Isaac W. Plewes and William Shaw, millers of Toronto, of a section of the frontage on Howard avenue in the factory district at a price of $1,000 per acre, for the erection of a 100-barrel flour mill. A by-law authorizing the transaction will be submitted at an early date. The Toronto men ask no exemptions.

MUNICIPAL

Chatham, Ont.—B. L. Bedford, chairman of the Public Utilities Commission, has received a communication from the Ontario Railway and Municipal Board in which it is intimated that the Chatham Gas Co. will be allowed to continue to use natural gas for generating electricity for the time being at all events. Following the investigation into the natural gas problem the order made by the Board was such that the Chatham Gas Co. would not be in a position, after a certain date, to manufacture electricity by using natural gas.

PERSONAL

George H. Madgett, who formerly was affiliated with the Hamilton Bridge Co., Hamilton, Ont., now is connected with the Standard Steel Construction Co., Welland, Ont., in an important capacity.

L. W. Adams has tendered his resignation as general superintendent of the Nova Scotia Steel & Coal Co., New Glasgow, N.S., effective Sept. 1. His successor has not yet been appointed.

James Carruthers has resigned from the presidency of the Halifax Shipyards Co. He is reported to object to the formation of a subsidiary concern which he contends may deprive the shareholders of the parent company of profits it might make.

Edward J. Albert, who for five years has been manager of the mining and power departments of Canadian Allis-Chalmers, Ltd., Toronto, Ont., resigned

GEOMETRIC

The Tap Famous For Good Work

Geometric Collapsing Taps share the popularity of Geometric Die Heads. They have the same good reputation for tapping inside threads that the Die Heads have for cutting outside threads. All objections of a solid tap are overcome in the Geometric Collapsing Tap. They are as rigid as solid taps while cutting, but collapse the chasers automatically when the required depth of thread has been cut. Are adaptable to Screw Machine, Turret Lathe or Live Spindle. Made in sizes suited to any diameter above ¾-inch in straight threads or standard pipe thread sizes.

Write for the Geometric Collapsing Tap Booklet.

The Geometric Tool Company

NEW HAVEN, CONN., U.S.A.

Canadian Agents:

Williams & Wilson, Ltd., Montreal.

The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.

recently. He now is sales manager of the Thwing Instrument Co., Philadelphia.

Mr. Gray has written extensively on coal and has done much to advertise the coal fields and industries of Nova Scotia. Besides writing a monograph on the coal fields of eastern Canada, he has been a frequent contributor to technical periodicals. It was Mr. Gray who introduced the oxygen breathing apparatus into Nova Scotia. He has taken great interest in first aid work and matters relating to miners' relief societies and the compensation of workmen for injuries.

William Starke, president of Starke-Seybold Ltd., Montreal, and a well known business man, died last Friday after an illness lasting only ten days. He was born in Montreal and had spent the whole of his life here, being known in many circles. He was 57 years of age and was a son of the late George Kinloch Starke. He received his education at local public and high schools, and his first business appointment was in a hardware establishment.

One more official of the Dominion Steel Corporation has been lost in the person of F. W. Gray, who severed his connection with the company and left for New Glasgow. Mr. Gray has been attached to the company since 1904 and during his 13 years' mining experience here had done much to modernize and improve conditions. Graduating in mining from Sheffield university, Mr. Gray obtained training from G. Blake Walker, who is now president of the Institute of Mining Engineers. He is a member of the council of the Canadian Mining Institute, a member of the executive and editor for the Nova Scotia Mining Society and a member of the Institution of Mining Engineers.

Captain Edward H. Phillips, E Co., 104th Infantry, an employee of the L. S. Starrett Co., of Athol, Mass., was killed in action in France on the 25th of July. Captain Phillips was an example of the finest type of young American manhood. Last spring he received the Croix de Guerre from the French Government. He was a sergeant when the company was formed and was rapidly promoted to second lieutenant, first lieutenant and captain. The L. S. Starrett Company has one hundred and twenty-four employees in the military or naval service of the United States and Great Britain.

MARINE

St. John, N.B.—Two wooden vessels were launched on August 7. The new vessels are the Celina K. Goldman, 477 tons, built at St. Martins, and the Vincent A. White, 460 tons, launched at Alma.

Fort William, Ont.—The first trawler built by the Canadian Car and Foundry Co. for the French Government was launched recently. The vessel was christened "Navrin," and the ceremony was performed by Miss Parks.

Platinum Found in British Columbia. A platinum and placer gold strike has taken place near Athalmer on Tobey Creek, a tributary of the Columbia river. The strike is extensive and the deposits both of platinum and gold are stated to be rich.

Vancouver, B.C.—The big 8,800 ton steel freighter "War Charger" was launched on July 27 at the James Coughlan Shipyards at False Creek. The christening ceremony was performed by Miss Grace Coughlan. The "War Charger" is 427 feet long, 54 feet beam, and is owned by Raeburn & Verel of Glasgow.

Paper Export Regulations.—Orders for export, except for Canada, may be placed in such quantities, size and weight as export requirements demand, without regard to domestic regulations, the pulp and paper section of the War Industries Board announced last Friday. This ruling applies to orders now on the books and to future orders.

Production of Anthracite in U.S.—Production of anthracite coal during the week ending August 3 established a new record for this year, with 1,75049,0 tons. In announcing this the fuel administration gave warning that this one week will not save the situation, and urged miners and operators to increased endeavor.

New Shipbuilding Records in July in U.S.—With the launching of 123 vessels totalling 631,944 deadweight tons, and the delivery of 41 others of 235,025 deadweight tons, new world shipbuilding records were established in July by American shipyards, the Shipping Board announced. The July launchings alone were greater than those of any single year in the past.

St. Catharines, Ont.—As the steamer Canobie, up-bound, entered lock eight, Welland Canal, late Saturday afternoon, she struck the two head gates and carried them away. The rush of water forced the steamer back in the lower level, but fortunately causing very little damage. The repair gang were quickly at work, and locking was resumed at 8 o'clock Sunday morning.

Brockville, Ont.—The steam barges Isabella H., and the McVittie, the two coal laden barges which went ashore in the Thousand Islands during the blow of Friday night, have been released, the former coming to Brockville and the latter proceeding to Montreal. The Compton, the third victim of the storm, is still on the rocks opposite Fine View.

Level of Lakes in July.—Lakes Superior and Erie attained a higher level in July than in June, according to the monthly summary prepared by the United States Lake Survey Office, Detroit. Lakes Michigan and Huron were the only lakes maintaining a level in July higher than the average for that month in the last ten years.

Three Rivers, Que. — The National Shipbuilding Corporation, of Boston, has orders for between eight and ten millions of dollars' worth of wood ships on foreign account, and has decided to have them built in this city, where it has just secured control of the yard of the Three Rivers Shipbuilding Co. The plant of this company having about 15 ways will be utilized for these orders.

"War Gaspe" Launched at Quebec.—Christened the "War Gaspe," the third three thousand-ton wooden steamer built at Limoilou shipyards of Messrs. Quinlan and Robertson, was launched recently. The launching was witnessed by a very large number of citizens who had congregated in the shipyard and surrounding frontages. The War Gaspe, built for the Imperial Munitions Board, is the finest vessel in construction and lines yet put out of the Limoilou shipyards. The War Gaspe, like her sister ships previously launched, measures 261 feet in length, and has a cargo capacity of 3,100 tons, and will be fitted up with 1,000 horse-power triple-expansion engines and steam generated by the latest type of water tube boilers. She is built of British Columbia fir, reinforced with steel and will carry no sail, being a standard steamer fitted out with Marconi wireless apparatus.

Kipawa Fibre Co.'s New Mill.—According to advices to hand, the preliminary work of erecting the large sulphite plant of the Kipawa Fibre Co. at the foot of Lake Temiskaming is under way. This plant is a subsidiary concern of the Riordon Pulp and Paper Co. Three hundred and fifty men are engaged in construction work by the George A. Fuller Co., which has the contract for the building of the new mill. The site for the mill, about 80 acres in all, has been cleared, and the contract has been let for the clearing of the townsite. The work of putting in the footings for the digesters and the shipping room is under way, the rock is being blasted away from the site of the power plant, and a coffer dam is to be erected soon. Sulphite pulp and all kinds of wood fibre will be turned out at the plant when completed, and the capacity will be large.

Crude Rubber Supply Curtailed.—Radical curtailment of the amount of crude rubber available for manufacture into pneumatic automobile tires may be expected in the near future. Conditions throughout the rubber business are such that the war necessities of the United States government are also certain to call for a sharp cut in the use of pleasure cars within 60 days. These two facts form the outstanding results of the meeting of all branches of the rubber industry on Wednesday at the Waldorf-Astoria, when representatives of the War Industries Board explained the situation to representatives of the rubber trade. The government expects the manufacturers to cut in two their output of pneumatic tires for pleasure automobiles during August and September. The programme also calls for restriction in production of many other semi-essential rubber products for the next two months.

Schooner Launched at Meteghan, N.S.—The first vessel built by the Howes Construction Co. of Boston and New York at their yard at Meteghan river, was floated on July 25 after several attempts had proved abortive. The new three-master is 150 feet long, 34 ft. 6 in. beam, 14.9 ft. depth of hold, with a gross tonnage of 485 and net 400 tons.

She is named the Richard B. Silver, and is a fine specimen of craftsmanship, having been built to fulfil the require-

Aikenhead's

Many doubting shop-owners thought it improbable that any chuck could increase output 50% and actually improve the work. They bought one or two Aikenhead's Wahlstrom Chucks, and soon after they ordered from half a dozen to a score. They found Aikenhead's

Automatic Wahlstrom Chuck

Holds Broken Tang Tools Secure

and that that is its least economy.

They found that their operators made no secret of their preference for this instantly acting, rugged chuck.

They saw it self-center tools perfectly, gripping by the entire shank and never slipping.

They timed their operators making tool changes with spindle of machine running.

They satisfied themselves it could be done **in two seconds.**

Anyone of them will recommend Aikenhead's Wahlstrom Chucks.

Chucks for straight shank and also for taper shank tools.

ments of the British Lloyd's rating, with whom she is classed A1, 12 years with a star, this being the highest possible rating ever awarded to vessels, unless built of Burmah teak wood.

She has been purchased by H. W. Adams and other of Lunenburg, N.S., and will proceed to Liverpool, N.S., to load for Buenos Ayres under the command of Capt. A. H. Zinck. The vessel is equipped with stockless anchors, has a Fairbanks-Morse type Z engine aboard, is fastened with galvanized bolts throughout, and is more than ordinarily heavily rigged. Mr. George B. Morecroft, the manager, is to be congratulated upon adding such a vessel to those already issued from St. Mary's Bay yards, and he has a second well under way, being built from exactly the same model. He will proceed to lay the keel of a third on the stocks recently occupied by the Richard B. Silver.

TRADE GOSSIP

Cutting Much B.C. Spruce.—Something like eighty donkey engines are on Louise Island, in the Queen Charlottes, and they are all working to capacity. Over a million feet a month of aeroplane spruce are being handled.

Gear Makers Meet.—The semi-annual meeting of the American Gear Manufacturers' Association will be held at the Onondaga Hotel, Syracuse, N.Y., September 19, 20, and 21. Announcement of the program will be given in a later issue.

Making Big Cranes.—The Dominion Bridge Company Limited, Montreal, has been awarded the contract for building two large shipbuilding cranes of the travelling gantry type with 7-ton man trolleys, for the Tidewater Shipbuilders. Limited, Three Rivers, P.Q.

Fairbanks, Morse & Co. Annual Report.—The annual report of Fairbanks, Morse & Co. just issued shows an unusual condition for a commercial concern in that with a capital of less than $3,500.000 it has a surplus and undivided profits of more than $11,000,000.

For Handling Coal.—The Dominion Bridge Company Limited, Montreal, has been awarded the contract for building two large coal handling bridges of the travelling bridge type equipped with clam shell buckets, for the Department of Naval Service, H. M. C. Dockyard, Halifax, N.S.

Great Britain Fixes Silver Prices.—The Treasury has taken the power to fix the maximum price of silver bullion. This, however, will not affect the market, as the price has been virtually dictated by New York since the value of the silver dollar was fixed.

Vancouver, B.C. — The Vancouver Board of Trade is making efforts to have Japanese freight shipped direct to ports in British Columbia instead of through United States ports, whence the bulk of it is transhipped to this province. The stringent United States regulations regarding shipments to Canada make it almost impossible to secure certain necessary foodstuffs which arrive from the Orient.

Marine Rates Advanced in New York.—Marine underwriters have advanced war risks on sailing vessels both for coastwise and trans-ocean routes because of the continued activity of U-boats in coastal waters. Rates jumped to 3 per cent. and in some cases to 4 per cent. for sailings between American ports, while trans-ocean rates were advanced to 10 per cent. by some underwriters.

Price of Copper Fixed in U.S.—President Wilson has approved continuance to November 1 of the existing maximum price of 26c per pound for copper, as agreed to by the Price-fixing Committee of the War Industries Board and copper producers. The price is subject to additional charges on copper shapes approved June 5. The producers pledged themselves not to reduce wages now being paid and to sell to the government, the allies and the public at the same price.

Scarcity of old iron.—"The iron and steel mills of the United States are greatly in need of scrap iron, the demand for which is far exceeding the supply," says the New York "Annalist." "Railroads have always been one of the largest sources of supply for scrap iron and steel, and a special effort is being made to have them accumulate the odds and ends which clutter up repair yards. Prices which this old material now command are so high that a collector is well rewarded for his efforts in getting it to market. It is said that if all of the old iron and steel were to be assembled there would be no shortage of steel."

Open New Department—The Aviation Department of the Imperial Munitions Board has taken over the building formerly occupied by the Stone Lithographing Co., near the corner of King and Spadina. It has been fitted out as an engine repair park to care for the work in all the aviation camps around here. This work has previously been done in various shops, and a certain amount of it was looked after at the Borden camp. There has been a long list of equipment filled by a local dealer, and it is estimated that the plant when ready to take on the repair work will have called for an expenditure of some $60,000.

Less Anthracite for the Railways.—The supply of anthracite coal for Canadian householders next winter will be helped out by an order of the Canadian Railway War Board, directing the railways to use no anthracite in stations or elsewhere, except in the Baker heaters used in passenger cars when heat from the engine is unavailable. These require anthracite. In addition to the annual 10.000.000 tons of bituminous coal required for locomotives and in railway shops, the roads had estimated their requirements of anthracite this year at 96,000 tons. Of this amount the new orders of the Canadian Railway Board will save over 60 per cent.

U. S. Steel Corporation Tonnage.—The United States Stteel Corporation's statement of unfilled orders as of July 31, which was issued yesterday, showed a decrease of 35.065 tons during the month. A change so small would have been of little significance in normal times, but, under present conditions it meant nothing. The corporation is assured of as much business for some time to come as the mills can handle. During June the bookings expanded more than 580,000 tons, representing, presumably, the filling of a large amount of government contracts. The total of forward business in hand on july 31 was 8,883,801 tons.

To Speed Up Cape Breton Mining.—Hon. A. K. Maclean expects to leave for Sydney, C.B., at the end of the week in an endeavor to stimulate production of coal from the Cape Breton fields. Advices received here are that production in this area is much below capacity and must be speeded up if a coal crisis is to be avoided next winter. At the present time the outlook is admittedly serious. A number of manufacturing firms are reported to be without prospect of securing necessary supplies and may have to close down. Complaint is made that owing to the high wages the miners now receive many of them are not working the full week, and production is suffering in consequence.

Scarcity of Coal in U.S.—Coal miners and operators are called upon in a proclamation by President Wilson to give their maximum effort to the production of coal to the end that threatened shortage next winter may be avoided. The President asks the miner particularly to work full time, and urges those who are essential to the industry to accept deferred classification in the draft. " The existing scarcity of coal," said the proclamation, "is creating a grave danger —in fact the most serious which confronts us, and calls for prompt and vigorous action on the part of both operators and miners. Without an adequate supply our war programme will be retarded; the effectiveness of our fighting forces in France will be lessened; the lives of our soldiers will be unnecessarily endangered, and their hardships increased and there will be much suffering in many homes throughout the country during the coming winter."

TENDERS

Woodstock, Ont.—Canadian Hosieries Ltd. will build a factory here.

West Vancouver, B.C.—The Nasmyth Lumber Co. propose building a sawmill in Dunbarton.

pumping station for the Town Council. Engineer, H. McAusland.

Quebec, Que.—Tenders will be received until 4 p.m., on Thursday, August 15th, 1918, for the furnishing and delivery of two vertical pumps for the Champlain Dry Dock, Lauzon, Co. of Levis, Quebec. J. K. Laflamme, district engineer, Department of Public Works, Post Office Building, Quebec.

Toronto, Ont.—Tenders will be received until Tuesday, August 27, 1918, for the construction of temporary barracks, Rosedale, Toronto, Ont. Plans and specifications can be seen and forms of tender obtained at the offices of the Chief Architect, Department of Public Works, Ottawa, and the Clerk of Works, Postal Station "F," Toronto, Ont.

Ottawa, Ont.—Tenders will be received up to noon, on August 19, 1918, for the construction of four pile and concrete foundations required for the coaling bridges to be erected on piers No. 4, H. M. C. Dockyard, and No. 9, Richmond, Halifax, N.S. Plans, specifications and permission to view the site may be obtained on application to the Admiral Superintendent, H.M.C. Dockyard, Halifax, N.S.

Levis, Que.—Tenders will be received until Thursday, August 15, 1918, for the furnishing and delivery of two vertical pumps for the Champlain Dry Dock, Lauzon Co. of Levis, P.Q. Plan can be seen and specifications and forms of tender obtained at the Department of Public Works, Ottawa, and at the offices of the District Engineers, P.W.D., Shaughnessy Building, Montreal and Equity Chambers, Toronto, Ont.

Winnipeg, Man.—Tenders, addressed to the chairman, Board of Control, will be received up to 10 a.m., on Wednesday, August 21st, 1918, for the supply and installation of five mechanical sprinkler stokers for the power house at the Municipal Hospitals, Morley Avenue. Specifications and form of tender, together with conditions governing tenders, may be obtained at the office of the city engineer, 223 James Avenue. M. Peterson, secretary, Board of Control Office, Winnipeg.

Ottawa, Ont.—By direction of the Hon. the Minister of Militia and Defense, the following old materials in Ordnance Depots in Military Districts No. 1, London; No. 2, Toronto; No. 3, Kingston; No. 4, Montreal; No. 5, Quebec; No. 7, St. John, N.B.; No. 10, Winnipeg; No. 12, Regina, and Headquarters Depot, Ottawa, are for sale by public tender at the stations named. All the articles may be seen on application to the Senior Ordnance Officer at the places named, each day, Saturday and Sunday excepted, between the hours of 10 and 12 a.m. and 2.30 and 4 p.m. and from whom any other information desired, can be obtained. The materials include old brass, cast iron, wrought iron, copper, nickel, steel, tin, lead, etc.

INCORPORATIONS

The Campbell Howard Machine Co., of Sherbrooke, Que., has been incorporated with a capital of $650,000.

PITTSBURG MARKETS

Continued from page 216.

jobbing trade, stating what could be done and emphasizing the fact that jobbers would have to file their pledges with the War Industries Board before any shipments could be made.

Production of pig iron in July proves to have been at the rate of about 40,700,000 tons a year, against rates of 40,800,000 tons and 40,900,000 tons in June and May respectively. The decrease is less than usually occurs with hot weather and the showing is regarded as altogether satisfactory. The number of furnaces in blast increases and it is the common expectation that after this month the rate of production will move sharply upwards, possibly even touching 43,000,000 tons. At best, however, the industry will do well if it makes up for the heavy loss of production early in the year by equalizing, for the calendar year, the 39,434,000 tons produced in 1916, the 1917 production having been 800,000 tons less.

The monthly report of steel ingot production is not out for July, but will probably show a slight decrease from the June rate, which was about 43,500,000 gross tons a year. As with pig iron, a large increase in output is expected with cooler weather. Thus far in August an exceptionally high average temperature has obtained, while July weather averaged about two degrees below normal for the month.

No rate of production that can be counted upon, however, even on the most sanguine basis, can cope with the estimates the War Industries Board makes of the requirements. The board rather startled the steel industry last month by stating that the steel requirements for the present half year were fully 20,000,000 tons. In a conference with the Fuel Administration lately, however, the board estimated the requirements at 22,000,000 tons, and asked the Fuel Administration to lay plans accordingly for supplying the necessary coal. The board has extended its estimates and now states the outlook is that 20,000,000 tons will be required for the first half of 1919. How these estimates compare with production can be observed, in a general way, from the statement that when in June the rate of ingot production was 43,500,000 gross tons a year, the output of finished rolled steel was at the same time about 3,000,000 net tons a month, so that, all things considered, the prospect is that between 18,000,000 and 19,000,000 tons will be produced during the current half year.

Of course there is no improvement in the outlook for steel supplies for the "less essential" commercial industries, those that are accorded no place on the preference list. By this time they are practically forgotten in steel circles where the difficulty is, first, to have any steel left after the priorities are taken care of, such steel being available for the preference list, being classified as Class C, and second, to make this surplus, if any, reach as far down the preference list as possible.

Scandinavia Belting
Works well in hot places

A number of instances have been brought to our attention where for transmission work in hot places Scandinavia was the only belt that would stand up. Even our competitors frequently recommend their customers to come to us when other kinds of belting have failed.

The dressing with which the belt is impregnated in the process of manufacture resists the action of heat and keeps the belt soft; this dressing, if the air is hot, will eventually dry out, and in cases of this kind the belt should be treated with a proper dressing occasionally to keep the belt soft and pliable.

We are often asked about the stretch in this belt. Yes, it does stretch and when hot there is quite a little stretch. If the belt is to be run where hot, leave the belt for some time where it can become well heated, then put on with a belt stretcher. Most of the stretch can be taken out in this way. Lots of Scandinavia belts are running fans in drying kilns, and are doing the work more satisfactorily than any belt previously used.

If you are in doubt about the purchase of a belt write us.

Federal Engineering Co., Limited
172 John Street, Toronto
NOTE—Do NOT use "bar" or "stick" belt dressing on textile belts

Classified Advertising Section

143 University Avenue, Toronto

If any advertisement interests you, tear it out now and place with letters to be answered.

Success and Your Associates

ALWAYS associate with men who are earning more money than you are. Such is the advice given by a man whose name is known the world over for his own success and the business which he created. It is good advice of a certainty, but we are not urging that it is the best advice. At the same time it is wise to associate with better or bigger men than you are yourself, because you are likely to be lifted up to their levels.

Most of us would probably like to be the intimates of J. P. Morgan, or of John D., or of Charlie Schwab, or Canny Andrew. If we had a speaking acquaintance with John Wanamaker, or Lord Beaverbrook, or Lord Shaughnessy, and with other distinguished and successful men, we would take comfort from the fact.

And most of us would feel rather small and uncomfortable if we were placed beside President Woodrow Wilson at a dinner table, or beside Sir Robert Borden, Sir Herbert Holt or Sir Wm. Mackenzie. And the reason would probably be that we know so little of the knowledge that really counts. If these successful business men engaged us in conversation we would probably find ourselves knowing very little about the things that matter.

This will illustrate the point:

Here's a true story. A Toronto manufacturer found himself on a train going to Albany in company with a number of distinguished Americans about to attend the inaugural ceremonies of a State Governor. A washout led to a delay, and the Canadian was thrown into close association with senators and congressmen and prominent lawyers. They bantered the little Canadian about Canada. He had the pluck of a bigger man. He had been a constant reader of THE FINANCIAL POST, and had absorbed many facts about Canada. He surprised his American travelling companions with his positive, well-informed and wide knowledge of Canada. When the company reached Albany, the Canadian was persuaded to attend the ceremonies and was introduced as the man who knew all about Canada. The Governor was interested in Canada, and said so, and the little Canadian found himself telling the story of Canada very ardently to a very attentive listener, much to the amusement of his friends who introduced him.

This man made a hit on that journey, and many friends. One of the company gave him a stock market tip worth a fortune.

The point of this story is: You, as a Canadian, can make yourself informed very fully and intelligently if you become a regular reader of THE FINANCIAL POST. You can make yourself a worthy companion and intimate of presidents and magnates. The world likes to listen to men who know something well, and who can talk interestingly and informingly on the subject of their study.

You can become worth listening to if you know your Canada well. And you can get the kind and amount of knowledge concerning Canada which will make you interesting to others if you will read THE FINANCIAL POST regularly each week.

IF you read THE FINANCIAL POST REGULARLY you will find yourself keeping company with the highest paid staff of editors engaged on any publication in Canada—trained men who know how to make others know what they know and learn.

You will find yourself living in a most interesting world—the great, throbbing world of business. You will have your thoughts tremendously stimulated and helpfully directed. You will find yourself becoming a fit table companion for big men — this because you will have knowledge of a quality that will keep you from shame.

What is it that keeps you and THE POST separated? It cannot be its subscription price of $3. Probably it is because you are not very well acquainted with this paper.

We are going to put it to you this way: If you have the desire to be worthy of association with big men, then prepare yourself for such association by reading THE POST, and to make acquaintance easy, we provide the coupon below. It offers you THE POST for four months for a dollar bill.

The MacLean Publishing Company, Limited,

Dept. C.M., 143-153 University Ave., Toronto.

Send me / us THE FINANCIAL POST for four months for One Dollar. Money enclosed / to be remitted

If what you need is not advertised consult our Buyers' Directory and write advertisers listed under proper heading.

The Eyes of the Factory

SO important is the safeguarding of employees' eyesight amid prevailing scarcity of man-power, that the Advisory Commission, United States Council of National Defense, appointed a special committee to prepare a code of lighting for mills and workshops. This committee had four objects in view, of which the chief was *Conservation of Eyesight.*

In progressive plants all over the country

LACO NITRO LAMPS

have proved themselves an important factor in accomplishing the results sought by just such legislation and by manufacturers who have themselves proved it profitable to meet, or even to exceed, the legal requirements.

The Correct Light for Shops working on Fine Products

Wherever skilled labor is assembled, eyesight is an asset so valuable that it cannot be too zealously guarded or assisted.

The clear, white, unwavering light produced by Laco Lamps, by means of a tungsten filament, burning at high temperature in rare inert gases, *provides a close approach to actual daylight rays.* It thus reduces the strain of artificially illuminated hours. In fact, Laco Nitro Lamps can almost be said to place day-shift and night-shift on an equality of productive power. In addition to *better* light, LACO lamps provide more *economical* light, by conserving electrical energy and lessening replacement costs—for Laco Lamps last 25 to 50 per cent. longer than other makes.

It will cost you nothing to obtain our expert advice on lighting problems—and may save you thousands of dollars. Write to-day for pamphlets.

A BIG IMPROVEMENT

Some time ago we bought the patterns, drawings and manufacturing rights of the "Original Montreal" Turning and Boring Lathes. Up to this time these lathes were the leaders of their type, but the increased strain of forced production gradually discovered the weak points.

In collaboration with the engineers of one of the foremost munitions plant of Canada (running over 40 Montreal Lathes) we have evolved a lathe which retained all the old valuable features, but which for pulling power and ability to withstand heavy strains is a tremendous improvement and we believe it is without an equal in its class.

THE NEW "MONTREAL-WILLIAMS" LATHE

ALL STEEL GEARS

PROGRESS

In keeping with the Progressive policy of this Company we have produced the

NEW 24" WILLIAMS PLAIN TURNING LATHE

Particularly suited for second rough turning and finish turning — it is a fitting mate for the new MONTREAL - WILLIAMS Rough Turning Lathe. Designed to do each job better and quicker than before, it is the logical answer to the cry for more shells.

Large Belt Power
Steel Gears (running in oil)
Enclosed Headstock (patent applied for)
Ball Thrust to Spindle
Large Wearing Surfaces
Special Carriage and Apron Construction

We cannot tell you all the good points here, but invite you to write us.

"DAVIDSON-IZED"

HIGH SPEED STEEL FORM TOOLS

"Davidson-ized" Steel means a process of intensifying and making the molecular structure more homogeneously continuous, obtaining results from the various alloys heretofore believed impossible, hence the steel becomes decidedly tougher with approximately 50% greater resistance to, abrasive wear. Consequently the cutting efficiency has been increased quite 50% as tests have proven.

"Davidson-ized" High Speed Form Tools, by reason of the labor they eliminated, actually increase the production output of your tool-making department. Munition makers and large manufacturers in Canada can get more tools from their old force by using "Davidson-ized" Form Tools than was ever before believed possible.

"Davidson-ized" High Speed Steel Form Tools are made according to your blueprints, patterns or drawings, and are delivered in rough form, ready to be machined, ground and hardened. This alone represents a 50% saving of the toolmakers' time.

These tools are guaranteed against breakage in hardening, and this insurance guards against great loss of labor and material.

RESULTS:
- ***Lower Tool Costs***
- ***Less Tool Expense***
- ***Less Machining***
- ***Less Grinding***
- ***Guaranteed Against Breakage in Hardening Process.***
- ***Greater Quantity Production***

Send Drawings, Blue Prints or Patterns and we will quote prices and speedy delivery.

DENNIS

Chain-Link FENCE

Protects Factories

Actual size of wire and mesh. Reproduced from photo.

They can't go through, get over or crawl under!

Here's positive protection for munitions plants, factories and war-order enterprises in these days of "mysterious fires," "unaccountable explosions" and vandalism of all kinds.

A DENNIS Chain-Link FENCE surrounds your plant with an impassable, insurmountable, unbreakable wall of woven steel. It enables you to centralize all entrances and exits, and scrutinize everyone entering the gates, providing day and night protection, supplementing the efforts of your watchmen, keeping away vicious, destructive, intruding undesirables, and stopping all losses due to petty thievery. Write for illustrated folder, NOW.

Peerless HIGH SPEED

A New Standard in Metal Cutting Increases Production 50% to 100%. Saves in Time, Labor and Material.

Take the older standard saws, some of which have been deservedly regarded as excellent machines, and add 50 to 100 per cent. to their output, and you will come pretty close to the productiveness of the Peerless High Speed. It has created a NEW standard of production, which is all its own.

Repeat orders tell the story. Some of them come from manufacturers who have had to wait for Peerless machines when they could get others at once, paying heavy express charges to get them quickly.

The Peerless High-Speed saves in time, labor, blades and material. It cuts faster, with a thinner blade, with less attendance and with a smaller consumption of saw blades than any other metal saw made.

Order a "Peerless" on 30 days' trial. We pay freight BOTH WAYS if it fails to make good.

PEERLESS MACHINE CO.

1607 RACINE STREET RACINE, WISCONSIN

Out

Without Delay WHY?

First: Because in our Extractor, we use a steel of different analysis than that in the taps themselves. Second: Because it is not tempered the same, for taps have to be left exceedingly hard in order to maintain their cutting edge and they are therefore brittle. Third: Because the Fingers of our Extractors are further from the axis of the tap than is any solid portion of the tap itself and they thus have a greater leverage in their favor; and Fourth: Because they are shaped to fit the grooves of the tap, using, therefore, the greatest amount of material.

Write for particulars of 60-day trial offer.

THE WALTON COMPANY
HARTFORD, CONN.

Standard the World over

The "RACINE" High Speed Metal Cutting Machine

Combination vise holds the stock close to the blade, enabling the operator to cut short pieces at any angle.

Cuts Angles, Channels, I-beams, Die Blocks, Pipe Tubbing, etc.

This is the machine for the shop that studies economy.

Built for Speed!

And the "Racine" is as Accurate as it is Speedy

In the **Racine High Speed Metal Cutting Machine** you get a tool with extraordinary productive power, and second to none in accuracy. It is compact, strong and rigid.

Saw frame guide of heavy semi-steel that will not spring. It holds the saw frame rigid, insuring accurate cuts.

All bearings long, heavy and adjustable, so that you can take up any wear that may occur from time to time.

We ship "Racines" on a trial basis. Get our proposition.

"You Will Yet Be Glad"

PRIVATE PEAT, who has sprung into fame through his books and extensive platform work, contributes an article to the August issue of MACLEAN'S MAGAZINE under the above heading. It is a cheery, optimistic message, contrasting conditions in 1914 with things as they are to-day. Private Peat, always a "headliner," is at his best in this article. But

Private Peat is only One of Many Features

In August MACLEAN'S there are half a dozen other writers with just as much "pull." Glance at this list:

"The Strange Adventure of the Man from Medicine Hat," a striking mystery story. By *Arthur Stringer*

"The Three Sapphires," a splendid serial story. By *W. A. Fraser*

"Keeping Borden in London," a fearless summary. By *Lt.-Col. John Bayne Maclean.*

"The Enemy Under the Earth," an article on the most terrifying phase of modern warfare—sapping warfare under the earth. By *Lt. C. W. Tilbrook.*

"Uplifting the Press," a satire on certain activities of the Dominion Government. By *One of the Uplifted.*

MACLEAN'S presents the vital and interesting things dealing with Canada—the most fearless criticism, the most entertaining comment, the biggest exclusive stories. Contributors to MACLEAN'S are the best writers and the most interesting personalities that the Dominion has produced. It is brimful of "features."

Nickel Genuine stands up under extreme heat

In foundries, glass works, etc., where machinery bearings are subjected to intense heat from without, in addition to the heat produced by friction, a peculiarly hard babbitt must be used. The mixing of such a metal is an exact science—a science rarely crowned with such a success as Hoyt's Nickel Genuine. This wonderful heat defier is made with scrupulous care, is always correct in mixture to an ounce, and can be relied upon to give best results where bearings are subjected to exceptional heat. **If you've had trouble with soft bearings try Nickel Genuine.**

HOYT METAL CO., Toronto LONDON, ENG. NEW YORK, N.Y. ST. LOUIS, MO.

MURCHEY

COLLAPSING TAPS AND SELF-OPENING DIES

for 75-155 mm. United States Shells

Flawlessly Accurate

Wonderfully Fast and Durable

Two Murchey Taps on your lathe completely finish these shells so that when they come off the machine there is no more handling or resizing to do. No need of taking the shell out of one lathe and putting it in another. No reversing, no stripping. No chance of work getting off center. Do work more accurately and 50% faster than solid tools.

Murchey Chasers are quickly adjusted to compensate for wear, and Murchey Adjustable Taps serve as long as ten solid taps.

Write at once for full particulars.

Murchey Machine & Tool Company, Detroit, Mich.

THE COATS MACHINE TOOL CO., Caxton House, Westminster, London, England, Glasgow, Newcastle-on-Tyne

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

COUNTING THE HOLES

SUCCESSFULLY THREADED BY ANY TAP IS THE ONLY SURE METHOD OF DETERMINING THE VALUE OF THAT TAP.

"MORSE" TAPS

ARE HANGING UP HIGH SCORES OF WORK WELL DONE AND, BEST OF ALL, CONSISTENT SCORES. THAT IS WHAT COUNTS.

THE MEN WHO USE THEM KNOW

MORSE TWIST DRILL & MACHINE COMPANY
NEW BEDFORD, MASSACHUSETTS, U. S. A.

Dominion Cast Steel Parts

Open Hearth Products

Machinery Castings of all kinds, Motor Frames, etc., for electrical trade, Pedestal and Miscellaneous Bridge Work, Rolling Mill and Blast Furnace Castings, Gears and Gear Blanks.

We are also prepared to furnish steel plate to 20" wide—for prompt delivery.

We have recently increased the capacity of our plant and can guarantee quick delivery on castings weighing anywhere from 100 lbs. to 50,000 lbs.

Quick Deliveries

Rockford Horizontal Boring Machine

For Automobile Manufacture

This tool is unusually rapid and accurate in the boring of crank cases, transmission cases and rear axles. Has two heads at right angles to each other. Spindles bore longitudinal and cross holes in work simultaneously.

Send us blue prints of your boring work and we will give you figures on the "Rockford's" ability on it.

The Rockford Drilling Machine Co., Rockford, Ill.

WE BUILD THEM BY HUNDREDS

Standardized Production enables us to offer this powerful Waterbury Grinder at such a low price. It grinds rapidly and accurately, all flat surfaces, dies, punches, planer, lathe, and other tools. Has adjustable table and tool rest with large radius of travel. Rigid, 3-point table supports giving great steadiness. A reliable, practical grinding outfit.

The Blake & Johnson Co., Waterbury, Conn.

Stow Shell Grinders Increase Production

Suspended Pedestal Mounted on Truck

Don't Talk Man Shortage With 6 Men on Pipe Work Where There Should be One

Don't let urgent war work lag for the want of men while you employ a gang of men instead of one man and a

Forbes Pipe Cutting and Threading Machine

on your pipe work.

The old-style stock and die method of cutting off 15-in. pipe required six men. It can now be done with one man and a Forbes Machine.

The motor-driven type follows the pipe-fitting work wherever an electric wire can be run. No hauling of heavy pipe to and from a stationary machine.

In the Forbes Machine the dies revolve. The pipe remains fixed in the self-centering vise. And the threads cut! They're the kind that make tight joints, because they're clean, accurate.

Write to-day for our catalog.

The Curtis & Curtis Co.

115 Garden Street, Bridgeport, Conn.

The Way to Greater Production

Catalog shows our plain and reversible types of Rotary Geared Lubricating Pumps. Now ready for delivery. WRITE.

The Trahern

There's little or no wear to a pump operated at slow speed. A Trahern Pump operated at slow speed will flood your cutting tools with coulant. With Trahern Positive Drive all the lubricant needed is discharged with sufficient force to reach the cutting point of the deepest buried tool. Advantages peculiar to Trahern Rotary Geared Pumps!

TRAHERN PUMP COMPANY, Rockford, Illinois

Is control of temperature on the instant an advantage?

Is it any advantage to bring a furnace up to required heat in less time and with less fuel and to be able to shut off the supply of fuel the minute work is done?

Is it any advantage to have a workshop without smoke and soot, without chimneys and flues, without coal and ash piles?

Is it any advantage to save space and the wages of stokers?

If it is—

At half the first cost of a coal burning furnace, own any one of the

"Mecol" Oil Burning Furnaces

and experience all the advantages they possess.

Mecol Furnaces are used in several of the largest plants in Canada—in many small plants, too.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,500,000, in General Use

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Cleco Never-Slip Clamp attached to Bowes Coupling.

In Stock:—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 14 mailed on request.

TYPE C-2

The Right Furnace For Every Purpose

THE types shown are only two of over one hundred types and sizes of Gilbert & Barker Furnaces—a furnace for every purpose.

G. & B. Furnaces are built right. Their construction and design have been perfected by our half century of experience.

We offer you the benefit of this experience and thorough knowledge of modern heat-treating methods through our engineering department. The service is free. Put your problems up to us.

Just now we are making prompt delivery of these two types and many others. Send for Stock List 24.

TYPE C-15

Gilbert & Barker Mfg. Co. West Springfield Mass.

Canadian Agents:
Williams & Wilson, Montreal, Que.

No. 1—2-Spindle Profiling Machine, Belt Drive
Use Code.....Babbling.

GARVIN

BELT-DRIVE PROFILING MACHINES FOR HIGH SPEED

The older method of belt drive possesses the advantage of great capacity for high speeds, and is still preferred where very high speed is a necessity.

The belt used in driving the spindle is one continuous belt coming from overhead drum, and passing under idler pulley to spindle; then around vertical idler, arranged to act as a tightener; then to the other spindles; back under rear idler to drum countershaft.

The machine has two former pins on the left-hand spindle slide, allowing for the machining of formers in place, using a sample piece in the work position.

Adjustments 15½" x 30". Clear height 5½".

Loss of Power Eliminated by Fitting

COVENTRY NOISELESS CHAINS

to your individual Machine Tool Drives

Illustration shows Darling & Sellers Lathe driven direct from motor 10 H.P. at 900 r.p.m. to 270 r.p.m. by "The Coventry" Noiseless Chains, a transmission which causes the machine to move steadily, while the output is rapid and continuous.

Write for our handbook C-3 on chain gearing. Post free for the asking.

Anybody Can Operate This Miller

and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

Mulliner

Here is a lathe you know will come through all the rough usage that 10 years may bring and be as fast and as accurate as to-day. And to-day it is extremely fast and absolutely accurate.

Sizes 12″ to 14″ with 4″, 5″ or 6″ bed.

This Mulliner Quick Change Engine Lathe bores and turns true to within .001 inch.

Its quick change mechanism provides different feeds.

There is no clashing when the tumbler gears engage — *just quiet speed*. The special design insures minimum wear.

A very strong, sturdy lathe.

SMALL TOOLS

P. & W. Adjustable BLADE REAMERS

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment. The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced. By a simple adjustment of the blades the reamers can easily be set to size without regrinding.

PROMPT SERVICE

TORONTO AUGUST 22, 1918

Measuring Direct Returns

EVERY advertiser is entitled to know what he is getting for his money.

Every publisher is anxious that his paper shall be credited with the returns which it produces.

Yet the fact of the business is that it is next to impossible to trace all of the results of advertising. Direct returns as a measure of the value of space are therefore inadequate, and fail to indicate the accomplishments of the advertising.

This is indicated in a particularly convincing way by the experience of a well-known book publisher, whose business is handled entirely by mail, and is therefore altogether the product of advertising.

All ads published are keyed; direct advertising is likewise watched carefully, with special key numbers, so as to enable the publisher to note the percentage of returns from each piece of advertising sent out.

In spite of all this, however, the business which can be definitely attributed to specific forms of advertising is only about fifty per cent. of the total.

In other words, at least half of the business cannot be credited at all, and yet without any question it is the result of advertising, because all of the business of the house is secured in this way.

As a result of his experience, this book publisher now multiplies the direct results of advertising by two in order to get a line on the complete results.

Most advertisers in other fields would probably be able to use a larger multiple, especially if they have salesmen and are following up their advertising in other ways, because in that event the situation is complicated by the opportunity for personal solicitation to interpose and take up the work where it was left off by the printed advertisement.

Consequently, when an advertiser says he didn't get results, an analysis of his business would probably demonstrate that results were secured, but were not credited to specific media.—*Class.*

If any advertisement interests you, tear it out now and place with letters to be answered.

SKF

The Electric Motor Bearing with a Service Record

SKF Equipped

This substantially built battery charging set, made by Hobart Bros., of Troy, Ohio, is equipped with SKF Ball Bearings. SKF Ball Bearings are used because of their simplicity, compactness, reliability and freedom from bearing troubles.

Actual experience has proven that SKF Ball Bearings have many decided advantages that cannot be overlooked. What these advantages are and further detailed information about motor mountings and applications are contained in Bulletin No. 70. Ask us to send you a copy.

Uranium
High Speed Steel

More Work In Less Time

Many manufacturers use various kinds of cutting tools before they try tools made from Uranium Steel. But after they once try Uranium tools they invariably adopt them as standard throughout their entire shop.

For Uranium High Speed Steel is exceptionally tough and strong, and so Uranium tools permit deeper cuts with greater speed.

This means a greatly increased production.

Give us an opportunity to prove it to you. Write us to-day.

The Flexible Spout of the All-Way Oiler

Goes to the Spot That Needs Oiling

The non-flexible spout of a common oil-can can, with patience, be got to within half a foot of half the oil holes and machinery parts that should be oiled frequently. Then, a liberal outporing of oil around the hole or around the part will likely result in a drop or two reaching the spot that needs it.

But—is it right that barrels of oil should be wasted? Do you choose to go on paying for your share of an enormous waste that is now needless?

No! Then send us your order for the All-Way Oiler whose flexible spout bends to any angle without breaking or interfering with the flow.

A cleaning device at the top end of spout prevents both clogging and a too-free flow.
The "All-Way" is made of durable copper-plated steel. The oiler illustrated is 5 oz., same size as No. 13 regular.

Machinist Tools and Metals

We have all high grade tools for machinists and woodworkers, and we endeavor to keep our stocks of metals, including semi- and high-speed steels complete. Let us know your requirements.

Some of its features are

—Change gears to accommodate highest speeds;

—Feeding—chucking—extracting of work and operation of die head entirely controlled by cams;

—Forced lubrication through the tool;

—Single lever control, for operators' convenience;

—Extracting and feeding practically simultaneous. (Hence a minimum idle time).

Let us tell you more definitely what the NAMCO Stud Threader can do for **you.**

Capacities up to 1" diameter.

Standard the World over

The "RACINE" High Speed Metal Cutting Machine

Combination vise holds the stock close to the blade, enabling the operator to cut short pieces at any angle.

Cuts Angles, Channels, I-beams, Die Blocks, Pipe Tubbing, etc.

This is the machine for the shop that studies economy.

Built for Speed!

And the "Racine" is as Accurate as it is Speedy

In the **Racine High Speed Metal Cutting Machine** you get a tool with extraordinary productive power, and second to none in accuracy. It is compact, strong and rigid.

Saw frame guide of heavy semi-steel that will not spring. It holds the saw frame rigid, insuring accurate cuts.

All bearings long, heavy and adjustable, so that you can take up any wear that may occur from time to time.

We ship "Racines" on a trial basis. Get our proposition.

Racine Tool & Machine Co.

15 Melbourne Avenue **RACINE, Wis.**

CUTS THREADS FAST, CLEAN and TRUE

The Forbes Pipe Cutting and Threading Machine

One man can do the work of six against old Stock and die method of cutting

These are not exaggerated statements—they are facts that are being proven every day by Forbes' Users. Inquire for yourself. Investigate its performance closely and you can't help but admit its labor-saving, perfect-working value.

Inexpensive to Operate

It is simple, compact, self-contained, and all wearing parts are adjustable. One man can operate it, and for heavy pipe work it can be taken right to the job.

Fitted with self-centering vise that holds the heavy pipe stationary, while the dies turn around it. The latter are clamped and released by a throw of the lever.

More 6" Shells

Do you want a substantial increase in your shell output with less labor and less cost? Adopt the Hepburn single bar boring lathe. Specially built to bore up to and including 6" shells. Speedy, powerful, accurate. Moderate in price.

We Rebuild Lathes

and equip them with all modern improvements. We do repairing of all kinds too. Let us hear from you.

John T. Hepburn, Limited

18-60 Van Horne Street - TORONTO, ONT.

Roelofson Banding Machine

for 75 mm. and 155 mm. Shells.

Excellent Delivery

Our manufacturing facilities are such that we can make excellent delivery on machines for the above sizes. To shell plants changing over to the 75 mm. and 155 mm. shells this should be of especial interest.

Experimenting in Munition Making is Past

AND likewise experimenting in munition machinery is past. The "experiments" are all in the discard and only the machines properly designed and carefully built have survived.

Roelofson Band Turning Machines have stood up consistently under three years of the severest service possible. They have met every requirement of production and serviceability and are still doing duty in many Canadian munition plants.

Don't experiment with your 75 mm. and 155 mm. shells. Use the machine that has a record of three years of service behind it.

Note these features of construction:

Integral (en bloc) construction assures perfect rigidity, permanent accuracy and desirable compactness.

Chucking with spring collet chuck insures accurate and speedy chucking.

Graduated feed dial, two cutting tools, and ample belt power insure output of accurate work in least possible time.

Machines are also built for 15, 18, 60-pdr. and 6-in. shells.

Shrapnel First Used in Peninsular War

Shrapnel Originally Invented by Lieut. Henry Shrapnel—In Its Early Form Very Different From Present-day Shrapnel, and Was Used in Muzzle-loading Cannon

By J. N. ROBINSON

MECHANICAL appliances for throwing projectiles were produced early in the history of organized warfare, and "engines invented by cunning men to shoot arrows and great stones" are mentioned in the Old Testament. These were continually improved, and under the various names of catapulta, balista, onager, trebuchet, etc., were employed throughout ancient and medieval warfare.

The machines finally produced were very powerful, and even when a propelling agent as strong as gunpowder was discovered and applied, the supersession of the older weapons was not effected suddenly nor without considerable opposition.

The date of the first employment of cannon cannot be established with any certainty, but there is good evidence to show that the Germans used guns at the siege of Cividale in Italy in 1331.

The first guns were small and vase-shaped. Towards the end of the 14th century, however, they had become of huge dimensions, firing heavy stone shot of from 200 to 700 lb. weight. A gun of this latter type is still extant in the Bombarde de Ghent, called "Dulle Griete." It weighs about 13 tons, is 197 inches long and has a bore of 25 inches. It fired a granite ball weighing 700 lbs.

The first projectiles fired from cannon were the darts and stone shot which had been in use with the older weapons. These darts had iron heads or were made of iron, and were wrapped with leather to fit the bore of the small guns, and continued in use up to nearly the end of the 16th century.

Stone Much Cheaper

Spherical stone shot were chosen on account of their cheapness. Lead, bronze, and forged iron balls were tried, but their cost prevented their general adoption. Further, as the heavy metal shot necessitated the use of a correspondingly large propellng charge, too great a demand was made on the strength of the feeble guns of that period. Stone shot being about one-third the weight of those of metal, the powder charge was reduced in proportion, and this also effected a great economy.

Both iron and stone shot were occasionally covered with lead, probably to protect the bore of the gun. Cast iron, while known in the 14th century, was not sufficiently common to be much used in the manufactnre of shot, although some small ones were made about that time. They were used more frequently at the latter part of the following century. Towards the end of the 16th century nearly all shot were of iron, but some stone shot were still used in certain styles of guns for attacking weak targets such as ship at short range.

Various Kinds Were Used

In the 16th and 17th centuries various other kinds of projectiles besides the solid ball were used. Amongst these were the following:

Case shot.—These are nearly as ancient as spherical shot and can be traced back to the early part of the fifteenth century. In the earlier forms lead or iron shot were packed in wood casks, in canvas bags or in cylinders of sheet iron. These shot were really the forerunners of our present shrapnel shell.

Grape shot.—This is now obsolete. It generally consisted of three tiers of cast iron balls, separated by iron plates and held in position by an iron bolt which passed through the center of the plates. Three was also another type called "quilted shot," which consisted of a large number of small shot in a canvas covering, tied up with rope.

Chain shot.—In the days of sailing ships these were in much favor as a means of destroying rigging. Two spherical shot were fastened together by a short length of chain. On leaving the gun they began gyrating around each other and made a formidable missile.

Red hot shot were invented about 1580 by the King of Poland. They were used with great success by the British during the siege of Gibraltar.

Marten's shell, was a modified form of the latter. Here a cast iron shell was

COL. BOXER'S SHRAPNEL.

filled with molten iron and immediately fired. On striking the side of a ship the shell broke up freeing the molten metal, which set fire to the vessel.

The Steps of Progress

From the early history of ordnance we see great changes in size, shape and build of cannon and projectiles from the 14th to the 17th centuries. From then on until the middle of the 19th century, very little progress was made. About 1854 breech-loading rifled guns began to replace the old muzzle-loading smooth-bores, and from then on until the present time we see enormous progress.

Explosive shell do not appear to have been in general use before the middle of the 16th century. About that time hollow balls of cast iron were fired from mortars. These balls were nearly filled with gunpowder and the remaining space with a slow burning composition. This plan was unsatisfactory as the composition was not always ignited by the flash from the discharge of the gun, and moreover the amount of composition to burn a stipulated time could not easily be gauged. The shell was therefore fitted with a hollow forged iron or copper plug filled with slow burning powder. It was impossible to ignite with certainty this primitive fuse simply by firing the gun. The fuse was consequently first ignited and the gun fired immediately afterwards. This entailed the use of a mortar or a very short gun, so that the fuse could be easily reached from the muzzle without unduly endangering the gunner. Cast iron spherical shell were in use up to 1871. For guns they were latterly fitted with a wooden disc called a sabot, attached by a copper rivet intended to keep the fuse central while loading.

The Work of Shrapnel

In 1784 Lieut. Henry Shrapnel, R.A., ((later Lieut.-Gen.), soldier and inventor, took up the study of hollow projectiles. He invented the forerunner of the present shrapnel shell. This shell was spherical in shape and was filled with lead bullets mixed with the bursting charge. A fuse arrangement, the same as that described for common shell was used.

In 1803 this shot case or shell was recommended for adoption into the service, and in the following year was first employed at the battle of Surinam. The results of its use in the Peninsular War were highly satisfactory to Wellington.

Although far superior to common shell in man-killing effect, their action was not altogether satisfactory, as the shell, on bursting, scattered bullets in all directions, and there was a liability to premature explosion.

In order to overcome these defects, Col. Boxer, R. A., separated the bullets from the bursting charge by a sheet iron diaphragm. The bullets were also hardened by the addition of antimony. Then, as the bursting charge was small the shell was weakened by four grooves made inside the shell and extending from the fuse hole to the opposite side.

The Shape was Changed

When breech-loading rifled guns supplanted the old smooth-bore muzzle-loaders, great changes were made in the shapes of the projectiles. Upon experimentation it was found that an elongated, sharp-nosed, shell would carry farther and more accurately than those of spherical shape, and these latter were gradually abandoned.

This new form was eventually used in the manufacture of shrapnel. But although its form was altered its character remained. The body of the shell was still made of cast iron, with a cavity at the base for the bursting charge, on this was placed a thick steel diaphragm, separating the bullets from the charge with a brass tube which communicated the flash from the nose fuse to the bursting charge. The body was filled with hard lead bullets and a wooden head covered with sheet iron or steel surmounted it and carried the fuse.

The new-shaped, elongated projectiles were at first fitted with gun-metal studs arranged around them in a spiral manner corresponding to the twist of the rifling of the gun. This was defective, for it allowed—as in the old smooth bores—the powder gas to escape through the clearance between the shell and the wall of bore (called the "windage") with a consequent loss of efficiency; it also quickly eroded the bore of the larger guns.

Many schemes were tried to give the shell rotation, and at the same time stop the leak of gases past the shell. In one case the bore of the gun was hexagonal in shape, with the shell to correspond. Another was elliptical. However, none of these produced the desired result.

Improvements Followed

Later the rotation was effected by a cupped copper disc called a "gas check" attached at the base end of the projectile. The powder gas pressure expanded the rim of the gas check into the rifling grooves and prevented the escape of the gas; it also firmly fixed the gas check to the projectile, thus causing the shell to rotate. A more regular and efficient action of the powder gas was thus ensured and a greater range and improvement in accuracy effected.

The late Lord Armstrong invented a shell coated with lead, which was forced into the rifling grooves of the gun by the pressure of the exploded powder gas. However, this lead coating proved too soft for the higher velocities of the modern guns.

Mr. Vavasseur, C.B., devised a plan of fitting, by hydraulic pressure, a copper "driving band" into a groove cut around the body of the projectile. This is now a universal practice with all kinds and sizes of shells. It not only fulfills the purpose of rotating the projectile, but renders possible the use of large charges of slow-burning explosive.

CAST IRON SPHERICAL SHELL.

Projectiles vs Armor

On the introduction of iron sheeted ships it was found that the ordinary cast iron projectile readily pierced the thin plating. Then, in order to protect the vital parts of the vessel wrought iron armor of considerable thickness was placed on the sides. It then became necessary to produce a projectile which would pierce this armor. This was accomplished by Sir W. Palliser, who invented a method of hardening the head of the pointed cast iron shell. These shells proved satisfactory against wrought iron armor but were not serviceable against compound and steel. Forged steel shell took the place of the Palliser shell. Carbon steel was first used, but as armor improved in quality projectiles followed suit, and the latest type of shell are formed of steel—either forged or cast—containing both nickel and chromium. Tungsten steel has also been used with success.

By making the body of toughened steel and by slightly reducing the size of the bullets, the number of these was much increased. Thus, with the cast iron body the percentage of useful weight, i.e., the proportion of the weight of the bullets

to the total weight of the shell was from 26 to 28 per cent., while with the modern steel shell it is from 47 to 53 per cent. The limit of the forward effect of modern shrapnel at effective range is about 300 yards, and the extent of front covered is about 25 yards.

This is indeed a far cry from the first spherical shrapnel which were liable to burst anywhere from the time they left the muzzle of the gun to when they hit the ground, and threw bullets promiscuously in all directions—or did not burst at all—to the highly efficient modern shrapnel shell such as used by the famous French and American quick-firing "seventy-fives," and the British "eighteen pounders," which hurl shell with a rapidity almost unbelievable and with an accuracy which seems uncanny to the novice.

A USEFUL CU-FE-ZN HIGH TEMPERATURE BRONZE

By M. Mark.

It is fairly well known that pure iron and copper will alloy together in almost any proportion, and it is also fairly well known that aluminum will alloy with both iron and copper in the absence of carbon, and while it also acts as a flux for both metals, a boron derivative has better effect. It is also fairly well known that bronzes which hold iron resist corrosion well, provided the iron is alloyed with the copper and is not a mere mechanical mixture. Zinc and tin will alloy with both iron and copper, provided there is no carbon present in the iron but in the presence of carbon, or when the iron is unskimmed and covered with dirt, trouble arises in practical working.

Absolutely pure, carbon-free iron is, of course, not commercially obtainable, but very fair samples can be had in the form of Swedish bars of some brands, some forms of boiler plates, and some brands of mild steel, the amount of carbon held both in the combined and graphitic states being extremely low, and while this in itself is a disadvantage it does not prevent alloying with copper up to perhaps 30 per cent. iron to 70 per cent. copper, where care is taken, and indeed, with many practical tests alloys that would roll well and also draw into tubes were produced with a content up to 20 per cent. iron, but above this there appeared to be trouble.

In all cases the procedure was to melt the iron, add somewhere up to 25 per cent. carbon-free ferro-aluminum to the iron, and when reaction practically ceased, the dirt was skimmed, and the copper heated to redness, put in and melted, the zinc made as hot as possible, being finally added, and then after stirring and skimming the metal was poured into ordinary sand moulds or metal ingot moulds as the case may be, the metal moulds being thickly lime-washed and dried prior to the molten metal being poured into them. In these cases, Swedish iron of the best quality was used, and for this reason the aluminum was low, but with some broiler plate punchings and other scrap irons of less purity up to 0.30 per cent. of aluminum was necessary, this necessitating a much larger percentage of ferro-aluminum. In any case, the amount necessary to secure the best results would have to be determined in the laboratory; but a small excess of aluminum would not matter, although it would increase the cost of the alloy. In every instance the exact composition of the alloy must be determined by practical trial to secure the best results in regard to the articles for which it is used, this being a very essential point, because not only do the metals used vary in content, but different degrees of hardness and strength are desirable under varying circumstances.

As the melting point of wrought iron is high, probably in most cases forced draught will be necessary in the furnaces, which, for the sake of economy, should hold four 75-lb. crucibles of the upright or barrel type, but of course, single pot furnaces can be used. In any case, from 2750° F. to 2975° F. must be secured or the iron will not melt readily, and where a somewhat higher temperature can be managed all the better; but this implies about the maximum refractoriness in both furnace linings and crucibles. Usually it takes about two hours to melt iron in a good furnace, while in a bad one it may take much longer, or the iron may even refuse to melt.

The crucibles should be of clay—in which case they only stand one day's work—or of plumbago with clay liners, as made by the Morgan Crucible Company, to take one instance; in either case the cost for crucibles being much higher than for ordinary bronze; but even at this the cost of the Cu-Fe-Zn alloy works out at very much less than the ordinary Cu-Zn bronze, when all costs are taken on a pre-war basis.

It must be particularly insisted on that the absence of carbon is the crucial point, but conjointly with this silicon must also be absent or the iron or alloy will absorb carbon and soon become a mere mechanical mixture of metals of more or less—generally less—perfect combination, which are liable to dissociate at very small provocation. In the experimental work carried out by the writer, both in regard to this alloy and to "Mitia" iron castings, it appeared that while a small percentage of combined carbon was not seriously objectionable so far as untested apparent effect was concerned, the presence of even 0.25 per cent. of graphite carbon had a very prejudicial effect, and in cases where grey cast iron was used in part or whole substitution of the wrought iron, a very imperfect mechanical alloy was secured in which the iron floated, and this quite independently of the presence of either tin or zinc or both combined. The only way by which a good mechanical alloy of copper and cast iron was produced was by the addition of aluminum in sufficient quantity to (on paper) make the specific gravity of the Cu-Al combination equal to that of the iron. In each case the trials were of a practical commercial character, not less than 56 pounds of the alloy being made at each operation.

There are no patents in force for the making of the bronze alloy mentioned, "Mitza" malleable wrought iron, or artificia. "Monel" metal, which is an alloy of nickel, copper and iron, and the only real difficulty in making these things is the high heat necessary and the absence of carbon in the metal. Good alloying skill is, of course, a necessity, but this, of all things, must be taken for granted as a general thing.

NITER CAKE FOR PICKLING BRASS

By Mark Meredith.

Niter cake, as a substitute for sulphuric acid in pickling brass, is finding extensive use in Great Britain. The quantity so used in that country now runs into several hundred tons per week. Difficulty in obtaining raw material, coupled with the increased demand for sulphuric acid for other purposes, has resulted in an extended application of niter cake solutions in place of dilute sulphuric acid for pickling annealed brass.

Niter cake is essentially crude acid sodium sulphate, and while the latter in the pure anhydrous state contains theoretically 40.8 per cent. of sulphuric acid, the free acid found in niter cake may vary from 3 to 30 per cent. For pickning, the niter cake solution should show 3 to 5 per cent. sulphuric acid on titration; there is no advantage to be gained in using solutions of higher acid concentration.

While niter cake is a variable product, annealed brass from a pickling point of view may be even more so. Given clean work, niter cake solutions replace dilute sulphuric acid quite efficiently, but with dirty work the difference is much more marked, and niter cake solutions, even under the most favorable conditions, may fail to pickle the work satisfactorily. It is little consolation for the manufacturer to know that his troubles lie in his annealing furnaces. Much may be done to overcome troubles as follows:

The niter cake solution should be as hot as possible. Its acid content should be tested frequently and maintained at 3 to 5 per cent. by the addition of niter cake. The hot annealed products may be quenched in water, whereby much scale is mechanically loosened prior to pickling.

The hot annealed work may be placed direct into the niter-cake solution, and the pickle can thus be maintained at a high temperature without auxiliary steam heating.

Electrochemical aid might be sought by using a low voltage current, making the lead lining of the vat the cathode and the work to be pickled the anode.

The difficulties met with in the successful use of niter cake solution can only be overcome in a satisfactory manner by paying close attention to the conditions governing the annealing so as to obtain the annealed brass as clean as possible, and by using the niter cake solution under conditions which will most strongly stimulate its pickling activity.

There's No Joy in Life for This H.S.S. Tool Bit

Things Used to Look Rosy When He Lay on Velvet in the Show Case, but the Life and Ginger Have Been Squeezed Out of Him Since Then—Real Sob Story by a Bit of Steel

By R. S. MYERS, BRIDGEPORT

WHEN H.S.S. WAS YOUNG AND KEEN

I AM a poor cripple. I have been twisted and contorted until I am nothing more than a mass of shapeless, sacrificed steel, with grains misplaced, sides twisted and out of line, grinds and cracks standing out here and there as a protest and protection against the friction of my square hole resting place, called a tool holder.

There was a time when I was fair to look upon. My skin was silvery and smooth like velvet. My sides were straight and shapely. My master was then proud of me. I enjoyed real freedom, the air and sunshine. Life then was a continual delight. But as I grew older my master became less thoughtful of me—he even left me in the tool holder locked up all night in the lathe tool post. I was not admired as much now. It was then that he began to criticize me—he discovered that I would not cut chilled iron and hardened steel. I soon realized that he considered me N. G., and my showings not up to the efficiency standards. He began by putting me into a fire that almost consumed me, and finished by dropping me in cold oil—I almost cracked on him on this occasion. I made him frown and grumble and scold for his ill-treatment.

My life thereafter was a steady torture. My master was hard for some time after he began ill-treating me, but I never knew a peaceful moment until I was turning C. R. S. or planing babbitt, when I would have a chance to work all day without being sharpened. But when the next day came I would again be thrust in my square hole chamber. At times I was almost split apart when a big monkey wrench forced the holding screw down on me. My close grain was forced so hard that the screw was actually expanded in the process.

I began to lose much of my feeling. I became hardened to suffering. I had to endure it. I was helpless.

Slowly and surely I lost my good shape, and my master's interest was less in a similar degree. I know on occasions he suffered lost time on account of his crimes against me.

Sometimes he would show me to some of the other boys and brag about how I cut such and such a steel at so many R. P. M., and at such times I would be hopeful. His sympathies for me and my hard knocks were at last awakening, but the next day I would again be similarly abused.

How I longed for my old home in the show case that greeted me in my younger days. My master then did not know about H.S.S.; true he could turn, mill, and shape, but when I came to him he was mighty proud of me and treasured me highly.

But when he began to crush the life out of me by welding me to a decrepit old piece of machine steel, he could not use such high speeds and feeds on his work. He finally lost his rep. for being the fastest workman in the room. His increased production was being replaced by minimum output. How I did abominate being welded to a simple piece of M. S. My master would attempt to force me to take a big bite, while I had all I could do to keep in my place—I broke my bonds twice, and was almost lost.

Now my master holds me on a M. S. shank in a more dependable way. His pride has borne many hard blows, but much of his trouble came because he maltreated me. He sold his record for the privilege of experimenting with me.

His reputation disappeared long ago. He has lost his energy, his enthusiasm. His record once on the production boards have been rubbed out. His interest has become indifferent.

And now my master blames me because I do not cut as at first. I chatter and squeak. He often complains, too, that the boss gives him no more "hurry up jobs." I tried hard enough to make him see that when ill-treating me he was injuring his reputation. He depended on me for a raise.

I gave him a proper foundation. Without my characteristics he could have never finished some of his jobs. Without my gifts he never would have held his job, and when he rehardened me—when he melted me and chilled me beyond recognition, he paid the penalty in full. The joys of maximum production were his only so long as he gave me proper consideration.

WHEN H.S.S. GREW OLD AND DECREPIT.

Lack of head work made me a poor cripple. Hardened steel and chilled iron turned with the mistaken impression that I would "bite anything under the sun," robbed me of my greatest asset, and the price paid by my master for his folly was the loss of many dollars in his pay envelope years and years before they should have left him.

Many attempts have been made to weld the particles of tungsten together by working at a very high temperature. No headway has been made in this direction. To be workable, a piece of tungsten must be substantially nonporous—that is, the individual particles must have been previously welded together at a temperature near the melting point of tungsten in an atmosphere of hydrogen or other gas which is either helpful or at least not harmful to the tungsten. Sometimes the swaged tungsten rods split during the swaging operation. Attempts have been made to weld these split portions together by working at a high temperature. The highest temperature available was 1700 -1800 deg. C. It was not found possible to weld the tungsten in this manner. Tungsten can be welded electrically at temperatures near fusion.

THE COMMERCIAL AWAKENING OF THE EAST

By Mark Meredith

JAPAN has thoroughly awakened to the possibilities of creating wealth and power by industry and commerce, and her neighbor China is awakening too, after a sort of sleep of many centuries for at one time she was, among the ancients, the foremost commercial nation. But the most interesting feature about the far East at present is the gradual development of a factory system, which is spreading, and travellers now talk about the factory towns of Japan and also of some parts of the industrial parts of China.

All the commercial centres are alive to the possibilities of development at the present time, for it is recognized that the greater the production of Japan in various articles and commodities which the Western Allies cannot give the time and attention to make the more she will keep the trade of the Allied nations going. The war has given the nations of the East many opportunities and as they are keen and enterprising business people they are taking full advantage of all that can be grasped. The Japanese were regarded as a coming force in the commerce of the world before the outbreak of the war but nowadays they seem to have "got there" for at various times many goods of Japanese origin have been on sale in towns all over Great Britain. There are many ways in which Japan is helping us in the shipbuilding, shipping and textile industries, and after the war she will certainly take her place as one of the great commercial nations of the East.

The position of Japan in the world freight market has witnessed a radical improvement since the war opened, but besides what has been achieved by the United States in this field of commercial activity, Japan's progress has been somewhat slow. The prosperity of the United States and Japan is due chiefly to Germany's submarine warfare, which has destroyed a large percentage of the world's merchant marine, and to the greater use of ships for war purposes by the belligerent powers. Great Britain has already lost nearly 45 per cent. of her merchant marine by the German submarine ravages and she has withdrawn many big merchantmen to carry troops and their requirements so that the greater part of her tramp fleet is not available for commercial purposes. Some regular liners have also been taken away from the trade routes where they had gained a firm footing through many years' steady work. From the far East, for instance, many well known liners have gone, and judging by the annual reports the directors of the different British lines, the results of wholesale withdrawal are viewed with anxiety for the places thus vacated are being filled rapidly by Japanese ships and the newcomers will gain a permanent footing.

It will be difficult for British lines to re-establish their influence and moreover, they will not have tonnage enough to do that. If Great Britain could afford to release shipbuilding yards from war service, the loss could be easily made good, but for the present nothing will be more difficult for that country to achieve. At least 600,000 tons of shipping are planned by her to be built, but it is too little to fill the gap. The United States, on the other hand, has been quite successful in enlarging her merchant marine, since the war opened. Although no accurate figure is available at present, it is beyond a doubt that her fleet has been more than doubled. Moreover, she is going to build a large number of steel and wooden ships for commercial use. In the far East the liners under the Stars and Stripes are still small in number, but on the Atlantic and in South American waters, their growing trade is striking.

Japan's gain since the war's opening is also striking. In the East she has, although not completely, succeeded in filling the gap created by Great Britain's withdrawal. On the Pacific also, most of the trade is hers. A most prominent instance of Japan's achievement is the Nippon Yusen Kaisha's inauguration of a Liverpool service. The regular trade on this particular route is now almost entirely carried on by the Nippon Yusen Kaisha, although in the Autumn of 1918 the Osaka Shosen Kaisha will start a service on this route. Japan has also increased her fleet immensely, in spite of the limited capacity of her yards, which is due to the precarious supply of steel.

In order to remedy this defect however, a law was passed at a recent special session of the Diet to encourage the iron industry. The main provisions of this measure are: (1) That iron and steel works with an output of not less than 35,000 metric tons per annum will have the right to expropriate the owners of property on which it is necessary to locate the works; and (2) that works turning out not less than 5,250 metric tons per annum will be exempt for eleven years from business and income taxes, and from all forms of prefectural local and municipal taxation, as well as being allowed to import free of duty the machinery &c., required for the works. The figure of 35,000 metric tons is based on the assumption that it is not economical to erect works with a furnace capacity of less than a 100 tons per working day for 350 days, while the figure of 5,250 tons is based on a production of 15 tons per day for the same period, this amount being fixed for the benefit of the smaller concerns. With great industrial activity existing in the country and the shipbuilding boom at its height, the passing of this new law has resulted in the launching of a number of new undertakings. Some of these schemes are financed and planned by important groups, which have been impressed by the large increase in the consumption of iron in Japan, especially during the last few months.

After the war, Great Britain will strive to regain her lost trade, and she will have to compete for that which has already been won by Japanese commercial enterprise. She is entitled to fair success in this struggle and as she has long occupied a position of importance in the shipping trade of the world, and as her seamen are excelled by those of no other nation, she will succeed in regaining her lost position in a great measure. The Germans will also strive to regain what they have lost, but it is by no means certain that they will succeed, for it will be difficult for them to rebuild their fleet. The United States will also have to strive hard if she is to retain what has been gained in the East during the war, for her weak point is the Seaman's Law and shortage in efficient seamen. If this weakness is remedied she can retain the fruit of the past endeavours. The outlook, however, for Japan itself in the after-war struggle for the retention of her shipping gains is not particularly hopeful as she has inflated her merchant fleet too much. It is questionable whether Japan can keep all her ships in full employ. Japanese seamen, however, have a strong point which will be important factor in the post-war competition. They can work at a lower rate than American or Britain seamen. The possibility of having to relinquish their war gains is perhaps the reason why the Japanese shipping companies are declining to receive further bounties from their government. They desire to be quite free and unfettered but the Japanese Government is determined to give the aid. Ignoring all application petitioning the government to stop further shipping bounties, the department of Communication ordered the Nippon Yusen Kaisha, the Toyo Kisen Kaisha and the Osaka Shosen Kaisha, Japan's largest shipping firms, to receive the bounty. Details of the amounts of the bounties and the names of the firms whichf have been ordered to receive it are:

European service:—This line should be maintained by the Nippon Yusen Kaisha semi-monthly with all ships, each of more than 5,500 tons and sailing at 14 knots, making 26 round trips a year, and for which the government is ready to subsidize 1,689,850 yen in 1918, and 1,569,672 yen in 1919.

Puget Sound service.—This line should e operated by the Osaka Shosen Kaisha bi-monthly with 6 ships, each of more than 5,500 tons, sailing more than 14 knots, making 26 round trips a year, and for which the government is willing

to give 2,669,925 yen in 1918 and 2,309,-187 yen in 1919.

San Francisco service.—This is to be maintained by the Toyo Kisen Kaisha four-weekly with 3 steamers each of 12,-500 tons, and sailing more than 18 knots, making 14 round trips a year. Owing to the fact that this line competes with more than one other foreign line, the government has refrained from announcing the exact amount of subsidy.

Pacific South American service.—The line must be operated by the Toyo Kisen Kaisha bi-monthly with 3 ships, each of more than 6,000 tons, sailing faster than 13 knots, making 6 round trips, and for which the government will give annual subsidy of 284,836 yen in 1918 and 269,-350 yen in 1919.

Australian service.—This line is to be operated by the Nippon Yusen Kaisha monthly with 3 ships, each of more than 5,000 tons, sailing faster than 15 knots, making 12 round trips a year, and for which the government will give 169,470 yen in 1918, and 188,497 yen in 1919.

Turning to the industrial development in Japan the installation of plant of all kinds is continually increasing for both machine-making and manufacturing. War conditions in Europe have given the Japanese business men a fine opportunity in metallurgical and shipbuildinng trades. The total number of mills now manufacturing machinery is 1,180—that is mills employing men of 18 years and over—and these probably do not include textile factories mostly staffed by young females. Machinery shops are now prosperous, and they include makers of spinning and weaving plants. There are 1,951 dyeing and weaving establishments in Osaka district, an increase of 288 over 1916, many of them being small concerns, probably employing only a few hands. Nevertheless, the number of workmen in May, 1917, was 78,827 an increase of 3,830 over May 1916. All other kinds of industry show an increase in mills and work people, which seems to indicate that Japan is performing a share of the war work, including munitions. The cotton mills appear to have had a good year. The balance sheets of two spinning companies have been recently published—the Toyo and Amagasaki companies; the former declared a dividend of 40 per cent. in addition to which both concerns placed large sums to reserve and carried forward an important proportion of the total profits. Accounts of industrial activity and advancement all round indicates that Japan is forging ahead in manufacture while Europe is fighting

Chemical Industry

Another remarkable feature of the economic development of Japan is her extraordinary progress in the chemical industry. At the commencement of the war this industry was still in its fancy, yet to-day Japan exports chemical products for the supply of which she was but three years ago entirely dependent upon outside sources. Whether when the war is over Japan will have secured the foundation of this new industry sufficiently well to maintain it, is another matter. Without an adequately protective tariff it is doubtful whether she will, for, in spite of the availability of some of the raw materials in Japan itself or in the countries near at hand, in spite of the great advantages she posses es in cheap labor, and the access she enjoys to cheap motive force by reason of her abundance of waterfalls, the chemical industry of Europe and the United States has gained such a footing in all parts of the world, that a new competitor is bound to have a very hard fight for existence when times are normal again. Nevertheless, the power of her industriousness and her genius, will secure her a place among the chemical producing nations, but it may take time as the chemical industry in Japan is an emergency one. Unable to obtain adequate supplies of chemicals from the ordinary sources of peace time, she has produced her own, and in some cases produced sufficient for export purposes. Great Britain can regard without envy the advent of Japan as a new competitor, but Germany will be the largest loser through the development of the Japanese dyestuffs industry. For many years to come Japan is bound to be a large customer of Great Britain for soda ash and caustic soda; in fact as she develops her other industries her need for these alkalies will become greater and, lacking what we possess, abundant supplies of cheap salt, it is at least doubtful whether Japan will be able in the near future to produce sufficient alkali to satisfy her home requirements. The production of soda was started in Tokyo, Osaka, and Yamaguchi Prefectures some thirty years ago, but, owing to the comparatively high cost of salt development has been slow. At the present time soda is being produced by an old system by the Canto Sanso Kaisha, of Tokyo Prefecture, and the Onoda Works, of Yamaguchi Prefecture. Accordinng to Dr. Toyokichi Tamatsu, one of Japan's distinguished industrial chemists, means have been studied for supplying industrial salt at a low cost, and, in addition, for working the ammonia and electro systems of soda making. Those engaged in Japan's progressive soap and glass industries—to mention only two of the commercial uses of alkali—would hardly consent without protest to a heavy protective duty on soda ash and caustic soda.

Turning to another branch of chemical industry, Japan has made wonderful progress in the production of Phosphorous; before the war Japan imported all the phosphorus she required for her match industry from England, France, and Germany. But now The Chemical Industry Company and the Fuji Electro-Chemical Company are manufacturing phosphorus from phosphite imported from the southern Pacific Islands, and some idea of the size of the output can be obtained from her huge export trade in matches. During 1915-16 she exported 14¼ million gross of matches, to India alone—this in spite of an Indian custom duty of 7½ per cent. Whether when English phosphorus again becomes available for export and prices become normal Japanese phosphorus will be the cheapest product for the match-makers to us remains to be seen. But, judging from the price at which Japan has been able to sell to India matches made from Japanese phosphorus, it would seem that the cost of its production from phosphorite is relatively low. Another match making chemical, potassium chloride, is being produced on an extensive scale in Japan at Aidzu, where the water power of Lake Inaswashire is utilized, and at various other places. It is also estimated that 10,000 tons can be made annually from seaweeds gathered on the coasts of Hokkaido, Karafuto, Chiba, and Kanagawa districts.

Japan is also making sulphate of ammonia from bye-products of the gas and coke factories and from nitrogenous lime The production of acetate of lime by the Japan Acetate Acid Company has also increased, and it seems probable that America will lose a good customer for the acetate. The Tokyo Gas Company is making carbolic acid, and the Japanese Dyestuffs Company has laid plans for manufacturing it from benzole. The yearly production of sulphuric acid in Japan is little short of three quarters of a million tons, and it is intended to establish a plant for the production of this acid by the contact process.

As to the dyestuffs industry, it is common knowledge that the Japan Dyestuffs Manufacturing Company has been founded and is backed by the government. Before the war Japan imported from Germany coal-tar colors to the value of something approaching a million pounds sterling, and, although the Japanese industry is still in its infancy, it is quite clear that Japan does not intend to go on paying such a tribute to Germany.

And in the Departments of Commerce and industry Japan is making rapid progress and there is little doubt that now her business men have awakened to the possibilities of trade and commerce her industries of all kinds will grow to a very great extent. There is no doubt Japan will make herself quite independent of Germany and German manufactures, and perhaps all the other Allied nations will follow her example.

Incorporation has been granted to the Campbell, Howard Machine Co. Ltd. The incorporators being residents of Montreal. The purposes of the company are as follows: To carry on the business of manufacturers of iron and woodworking tools and machinery, iron founders, steel makers, brass founders, metal workers, millwrights, machinists, etc. The capital stock of the company is placed at $650,-000 and the head office will be at Sherbrooke, Que.

Heating and Ventilation Are Very Important

When a Factory is Being Constructed All These Details Should be Attended to—It is Sometimes Possible to Make Changes in Plans to Secure the Best Results

THE SECOND OF A SERIES BY M. H. POTTER.

THERE are many systems of heating buildings, among which are: By means of exhaust or live steam in lines of pipe arranged overhead or along the walls, by coils or radiators, by hot water utilized in a similar way; by air furnaces, or by contact with pipes through steam flows. All these systems have their good and bad features, both as to their warming qualities and their cost, as well as the expense of operating them. The hundreds of feet of steam pipes, with their numerous fittings, furnish at each joint opportunities for leaks, and special arrangements must be made to keep them clear of water. The distance from the boiler to the further end of long systems frequently requires much time to force the steam through to these points to warm the rooms so that they will be endurable to workmen.

The hot water system works slowly and the temperature of the surrounding air rises gradually, so that the hour for beginning work in the morning must be anticipated by such a length of time as to be a serious drawback to complete success. The hot-air furnace gives air from which much of the moisture is evaporated and which is therefore unwholesome, aside from the fine dust so often brought along with it. In all these systems heating is the only end gained, ventilation being left largely to chance.

The ideal system of warming and ventilation would seem to be that in which fresh air, warmed by steam heat, is distributed by a suitable mechanical progress, as evenly as possible to every part of the building, and one in which this can be done in the shortest time (as in most shops heat is not maintained during the night except at sufficient temperature to prevent freezing of water pipes, etc.), and in which cold air may be readily introduced whenever needed.

This seems to be best accomplished by drawing fresh air from without the building, passing it through a heating apparatus consisting of an iron case containing a large number of steam pipes, and by means of a fan and suitable pipes, distributing this warmed air to every part of the building by numerous outlets. The whole should be controlled by proper dampers, by which a due proportion of warm and cold air may be furnished as needed, so that proper ventilation as well as warming may always be maintained.

FIG. 4—CROSS SECTION OF FOUNDRY HEATING SYSTEM.

In the warming of such large buildings as those under consideration it is not necessary to draw cold air from the outside atmosphere to any great extent. The number of cubic feet of air contained in the building is largely in excess of that required for each person, and, cold air comes in through frequently opening large doors, while the swinging windows at the roof may be opened when necessary to permit the vitiated air to pass out, thus providing ample ventilation.

FIG. 3—PLAN LAYOUT OF FOUNDRY HEATING SYSTEM.

The heating apparatus should be located near the center of the building so as to distribute the warm air to all points with the least amount of piping. Openings should be so arranged as to be not over 30 feet apart, and to open toward the outer walls of the building. They should not be less than 8 feet above the floor, nor less than 5 inches diameter, and usually incline downward at an angle of about 10 degrees. The aggregate area of openings should exceed the area of the main pipe at the fan by about 25 per cent.

About 6 square inches area of openings should be allowed to every thousand cubic feet of space contained in the building or room, where the building is so divided. The velocity of air should not be less than 1,500 feet per minute, and a sufficient quantity should be supplied to change the air about every 25 minutes.

The pipes are preferably circular, as less material is required to make them of this form, circular pipes are stronger, and there is less friction of air in passing through them. However, square or rectangular pipes are sometimes necessary on account of lack of space. When such is the case this area of cross-section must be increased accordingly so as to overcome undue friction. Galvanized iron is the most desirable material for these pipes and is almost universally used where pipes separate from the building construction are used. In factory buildings having several floors, proper flues and air ducts are arranged in the walls, and in the basement, where the heating apparatus is usually located.

Machine Shop Arrangement

Fig. 1 shows the plan of arrangement of the heating system of the machine shop and Fig. 2 a cross-section of the same.

The heating apparatus consists of a rectangular iron case containing a large number of steam pipes of practically U-shaped form, inverted and connected to a cast iron base in such a manner that one leg of the pipe connects with the space through which the steam is admitted and the other leg connects with the space from which the drip is taken. These pipes should be located as close

to each other as practicable, the rows of pipes being set staggering so as to break up the currents of air. The casing which surrounds them and connects with the inlet of the fan should also be formed as closely to the pipes as may be, in order that all air which is drawn through may come into close contact with the heating surfaces of the pipes.

It is customary to allow one foot of 1-inch pipe, or its equivalent, to each 100 to 150 cubic feet of contents of the building to be heated, when all the air is taken from out-of-doors. In the case under consideration, with one-half or more of the air from within the building the higher figure would probably be ample. At the end opposite the fan are located dampers for regulating the amount of air supply. One of these may be connected with a cold air duct from out-of-doors where necessary.

FIG. 1—PLAN ARRANGEMENT OF MACHINE SHOP HEATING SYSTEM.

Referring to Figs. 1 and 2 the location of the apparatus is seen to be in the gallery floor, near the centre of the building. The fan has two discharge openings, one downward for warming the side wings of the first floor, and one at an upward angle for the same service on the gallery floor. The returning currents of air flow into the central portion of the building and warm that portion in their upward course.

Two sets of apparatus are used, for the reason that the traveling crane over the centre portion of the shop prevents convenient connections between the two sides; and further, that the space to be heated is so large that the questions of convenience and economy are best met by this arrangement.

The apparatus on the side nearest the power house will require a fan with a wheel say 100 inches diameter by 52 inches wide, and running at about 185 revolutions per minute. This will supply from its downward opening the pipes for the main floor, including that leading to the carpenter shop and to the wash room on the first floor, and from its upward opening it supplies the pipes from the gallery floor, including one for the wash room on the second floor.

The apparatus on the opposite side of the shop should have a fan with a wheel say 90 inches diameter by 48 inches wide, running at about 250 revolutions per minute. The pipe connections are similar to the first apparatus, except that there are no long branch pipes to be provided for. Hence, while a 36-inch pipe is necessary for the side toward the power house, in order to warm the carpenter shop and the wash rooms, one of 29 inches diameter will be quite sufficient for the opposite side. It should be said that the dimensions given on the drawings are from actual calculations, taking into consideration all the circumstances of the form and dimensions of the buildings, and they will probably be found correct in practice as well as theory.

The openings for the discharge of warm air into the building are directed toward the outer walls and downward at an inclination of about 10 degrees. This arrangement is clearly showing in the drawings Figs. 1 and 2.

The pipes should be well riveted as they are put up, and securely fastened so that they may not be loosened by any jarring or vibration, either of the buildings or that caused by the pressure of air passing through them.

FIG. 2—CROSS SECTION OF PIPING ARRANGEMENT FOR MACHINE SHOP.

The fans may be driven by an electric motor or by an engine attached to each fan, or by belts from the main line of shafting.

Live steam should be used for heating. The large apparatus will probably require a supply pipe of 6 inches in diameter and the smaller one of 5 inches. The apparatus should be so constructed that a section of it may be separately connected for using the exhaust steam from the fan engine. In the same way the exhaust from the main engines of the works may be utilized and thus save a considerable portion of the live steam required.

Heating Layout for Foundry

In arranging for heating the foundry, different conditions are met with. With the exception of the chipping and pickling room heat is required hardly more than half the time, that is, during the forenoon, and perhaps for an hour or more after the dinner hour, as the heat from the cupolas is considerable. The general plan of the system is the same as that employed in the machine shop. The apparatus requires but little room on the floor and consists of a fan having a wheel about 78 inches in diameter and 24 inches wide, running at about 400 revolutions per minute, and will require about six horse-power to drive it.

An arrangement of pipes can be made whereby the chipping and pickling room could be warmed independently of the foundry proper, but it would probably not be necessary.

Figs. 3 and 4 show the arrangement of the foundry system of heating, with diameters of the pipes and openings. It will be preferable to run this fan by an electric motor, and since these fan blowers for heating purposes are now made with simple and compact engines attached to them, which require very little attention, aside from starting, stopping, and oiling, they are very convenient in such situations.

It is always important to have the heater as near the space to be warmed as possible.

System for Other Units

The office building, including the pattern shop, drawing room, and tool department, is heated by an apparatus located in the tool room and forming a separate system. It may be driven by a separate motor, or belted from the shaft which drives the machines in the tool room. The latter plan is probably the best, since the power is convenient, and the first cost may be lessened without sacrificing any desirable feature in another direction.

The main pipe passing through over the driveway must be amply protected, the space being filled with sawdust or similar material, and this again is covered by another box large enough to leave an air space of about three inches between the two, on all sides.

For the office rooms the pipes may be of rectangular form, concealed by suit-

able architectural finish of the ceiling, in which lateral openings for registers may be made. Or, proper air ducts may be formed in the side walls and the registers placed at suitable intervals. Or the pipes may be carried around inside the walls, close to the ceilings, and registers located in the same manner.

There may be for this system the double-duct arrangement. That is, two sets of pipes or ducts, one carrying cold and one warm air, the registers being so arranged that they will furnish one

FIG. 6—CROSS SECTION OF SAW-TOOTH LIGHTING SYSTEM.

or the other, or a mixture of both, by means of what is technically known as a "mixing damper."

In offices and rooms of moderate size which are heated by warm air being forced into them near the ceiling, it is usual to provide means of escape for the air as it cools and descends to the floor, through grated openings placed two or three feet from the floor, and connected with flues or ducts leading to the roof. But in offices where doors are frequently opened this does not seem to be necessary, the problem of ventilation being of small consequence compared to that of heating.

The forge shop and various other buildings require no special arrangements of heating.

Suitable Temperatures

The question of proper temperature of shops where men are at active work should be considered as quite different from providing for heating a factory where the work is usually much lighter, the number of employees per hundred feet of floor space much greater, and frequently a large proportion of them females.

In a machine shop devoted to a medium class of work, a temperature of about 60 degrees will be found comfortable. The temperature in the storeroom, tool room and pattern shop will need to be about 65 degrees, and the drawing room and offices, between this and 70 degrees. Unless the ventilation is very carefully attended to, there is more danger in having these latter rooms too warm than not warm enough, and any system of heating which does not recognize the importance of good and thorough ventilation is radically wrong in both theory and practice.

Natural Lighting

For properly lighting a shop during the daytime, many forms and portions of windows have been devised, from those of small area and diminutive lights of glass, to those very high and narrow, those broad and low; those of large area placed far apart; those of much less area placed near together; those covering almost the entire wall with glass area; those placed vertical and those in an inclined position; those placed as skylights in the roof; and those placed in the ventilating space at the top or ridge of the roof.

Again, as to the kind and quality of glass used. Some prefer the ordinary plain glass, admitting a flood of light, regulating it by means of shades or curtains. Others use the same glass, stippling the surface with white zinc thinned with spirits of turpentine to relieve the eyes of the glaring light. Rough glass and ground glass is often used.

What is called ribbed glass with the ribs running in a horizontal direction, is probably better than either. In viewing these various methods of construction it may be said that broad and low windows in the side walls will light the bench at the wall and perhaps two rows of machines, where the centre of the room receives little or no illumination. This condition is sometimes sought to be remedied by the use of skylights in the roof.

Windows placed too high in the side walls will light the centre of the room but leave the benches around the walls in the shadows of the high window sills. Therefore it is proper to so locate the window sills as to afford proper light at the bench vises; then to continue the window well up to the ceiling in order that the whole room may receive, as nearly as may be, an equal quality of light.

Fig. 5 shows a cross-section through the machine shop, and gives the floor surfaces illuminated by parallel beams of light at various angles. It should be understood that in all these cases light is not confined to these surfaces, since it is always more or less strongly diffused over a much larger space. These diagrams are only intended to show the relative amount of illumination.

Fig. 6 is a cross-section of the newer form of saw-tooth roof construction. All illustrates the largely increased amount of surface lighted up by this method, which is now generally regarded as the best practice for lighting large areas in one-storey shops.

The width of the windows and the distance apart is a matter of great difference of opinion.

Artificial Lighting

Let us now consider the question of artificial light. To properly provide for sufficient lighting, we must select some one of the many systems in use, and the one which seems best adapted to the conditions of the case. To provide an ample, proper, safe, and thorough system of illumination for buildings in which a large number of persons are obliged to labor for so many hours each year by its aid would seem to be a matter that need not be argued or advocated. Yet there are many shops at the present time so constructed that some kind of an artificial light is needed all through the day, and in some nearly all seasons of the year, and this condition prevails over a considerable part of the working period.

In the application of electric light in manufacturing operations we have the choice of the arc lamp and the incandescent lamp. Both have their objections as well as their merits. The arc lamp, being much more powerful and projecting its rays a much greater distance than the incandescent lamp, is well adapted to illuminating large areas, where there are comparatively few objections. In confined situations, or where there are many obstructions, it produces disagreeable shadows, and its glaring brilliancy is hurtful to the eyesight of the workmen.

Translucent globes or shades may be used, of course, but these devices necessarily reduce the illuminating power of the lamp.

The incandescent lamp gives a much softer and more agreeable light to the eyes of the workmen, who may work many hours by its aid with less discomfort than by almost any other light. It is also much more portable than the arc lamp, since it may be provided with flexible conducting cords of any convenient length, and hung up or held in the hand in the most desirable position.

In the machine shop the clear space needed for the travelling crane precludes the suspending of arc lamps through this central portion, but they may be placed between and a little inside of the line of the columns. From the character of the machines employed and the work done in the galleries the incandescent lamp will be the most suitable. There should be at least one to each machine and in the case of long lathes one to every ten or twelve feet of bed.

The large open space of the foundry may well be provided with arc lamps.

The core room, wash rooms, offices, etc., will require incandescent lamps. The forge shops will be best served by two arc lights in the main part, and by incandescent lamps in the foreman's office.

The entire front building, including the offices, tool rooms, pattern shop, pattern storage loft, drawing room etc., should be lighted by incandescent lamps, those in each room being arranged to suit the peculiar conditions in each case, as to the kind of shades and reflectors employed.

AERO-PROPELLER SHAPING MACHINE

Aeroplane propellers, as is well known, are usually built up of laminations of wood of equal thickness glued and dowelled together. The built-up body is subsequently worked to the required shape very frequently by a purely hand-tool process. This method of finishing the

body naturally calls for the exercise of highly skilled workmanship and is essentially slow. While the aero-propeller is geometrically a very complicated body, it is not impossible to reproduce its form by mechanical means with the requisite degree of accuracy. Much attention has been devoted to this matter, and as a result there are now obtainable, or in use, several forms of propeller-shaping machines.

PROPELLER SHAPING MACHINE. FRONT VIEW.

One of the most recent British designs of such a machine is illustrated in the accompanying engravings, for which we are indebted to the "Engineer." This appliance is manufactured by A. Ransome & Co., Limited, of Newark-on-Trent, who have brought it out in conjunction with Mr. J. J. Kerr, of Lincoln. The design is patented. Like all other machines of its class, it works by copying the profile of a model blade. So far as we know no machine has been designed to generate the form of an aero-propeller, the reason being probably the difficulty of dealing with the varying convex curvature of the forward face.

In the Ransome-Kerr machine the model propeller blade and the work are rotated at the same rate on parallel axes, the angular position of the model on its axis being 90 deg. in advance of that of the work. A travelling carriage provided with a rotating circular cutter head is fed slowly along a screwed shaft fixed within the frame of the machine. A copying roller bears against the surface of the model and swings the carriage about the screwed shaft as axis. An angle of 90 deg. being included between the lines joining the centre of the screwed shaft with the centres of the cutter and roller, the profile of the model is thus reproduced facsimile on the work as the carriage is fed along the screwed shaft.

The propeller being worked to shape is held by a bolt passing through its boss and two flanges formed on a circular cast iron driving head rotating within a casing which is bolted to the machine bed. The tip of the blade actually being operated upon is supported on a back centre at the end of the tailstock spindle. This spindle is of considerable length, to enable propellers of various diameters to be accommodated. The model blade is similarly supported between a driving head and a tailstock fixed to the side of the machine frame. The two driving heads are driven at equal rates through cut gearing from a belt-driven countershaft lying within the bed of the machine directly below the screwed shaft for the cutter carriage.
